1.0 EXECUTIVE SUMMARY

LE Environmental LLC (LEE) conducted a Phase I Environmental Site Assessment (ESA) of Brattleboro Town Parcel ID #80026.000, the Neenah Paper Manufacturing facility at 161 Wellington Road, Brattleboro, Vermont 05301 (property). The ESA was conducted pursuant to the American Society of Testing and Materials (ASTM) Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM E 1527-13).

This assessment was conducted for the Brattleboro Development Credit Corporation of Brattleboro, Vermont (BDCC). The property owner of record is Fibermark Office Products, LLC. The document users include BDCC, Long Falls Paperboard, LLC, the Vermont Agency of Commerce and Community Development, and People's United Bank.

The property consists of a 39.52-acre parcel at the north end of Wellington Road in Brattleboro, Vermont. The property hosts an operating paper mill employing approximately 100 people. The mill accepts pulp and recycled paper from outside sources, and manufactures 7-ply hard stock product used for report covers and similar applications. The property was undeveloped except for agricultural use and an overhead power line until 1960. The first building (main plant) was constructed in 1960-61. Additions to the building were made in 1967, 1973, 1974, 1978, 1982, 1988, and 1996.

The property is Vermont Department of Environmental Conservation (DEC) Site #90-0482 due to a #6 fuel oil release discovered during UST removals in 1990. Residual fuel oil, which appeared to be solidified and immobile, was left in the ground. A Site investigation was performed, and the property received a Sites Management Activity Complete (SMAC) letter. No further investigation of the fuel oil release is being required by DEC at this time.

Groundwater beneath the northern portion of the property (north of the lagoons) was reclassified by DEC to Class IV (non-potable) due to influence from the adjoining closed Windham Solid Waste Management District (WSWMD) landfill.

Chlorinated volatile organic compounds (CVOCs) were detected in the groundwater near the plant during the Site investigations. The cVOC concentrations diminished from 1990 to 1994 and by 1994, none of the cVOC concentrations exceeded groundwater standards. The cVOCs were also present in the groundwater west of the plant.

The property is on the DEC's Underground Storage Tank (UST) registry and has two active 25,000-gallon #6 fuel oil USTs. The plant's primary heating source is compressed natural gas and fuel oil is a backup source of heat for the plant. Five USTs were also documented as being removed in 1988 and 1990.

The property is a RCRA Large Quantity Generator of hazardous waste (mostly oily rags and oil/water), a Toxics Reduction System inventory location, a hazardous waste manifest generator, a reported spills location, a registered above ground storage tank location, a PCB Transformer registry location and a Vermont Tier 2 inventory location. The property was on the EPA Clean Water Act watch list in 2013.

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527 of the Neenah Paper Facility, 161 Wellington Road, Brattleboro, Vermont, the property. Any exceptions to, or deletions from, this practice are described in Section 11.0 of this report. This assessment has revealed no evidence of recognized environmental conditions in connection with the property except for the following.

1. Documented #6 fuel oil release (historical REC and REC) due to leaking USTs.
2. Potential petroleum contamination due to diesel and gasoline USTs removed in 1988.
3. Use of the property for paper manufacturing for 58 years, which may have resulted in soil, groundwater and/or soil vapor contamination. Potential contaminants of concern include volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), metals, dioxin, and PFCs.
4. Potential chemical and petroleum discharge to basement floor sumps and underground piping of unknown integrity possibly resulting in releases via piping breaches.
5. Visible and potential releases from equipment in the storage yard.
6. Potential for subsurface contamination due to an abandoned drum.
7. Filled area at the north end of the property with undocumented fill materials.
8. WSWMD landfill documented and potential influence on the property's groundwater quality (Controlled REC).
9. Potential soil and groundwater contamination from the active septic system north of the mill.
10. Potential soil and groundwater contamination from the unused septic system east of the mill.
11. Potential contamination in connection with the active rail line adjoining the west side of the facility.
12. Potential releases of hazardous substances and/or petroleum products from the historical printing press adjoining the property to the west.

A Phase II ESA is recommended to determine whether the identified RECs have resulted in subsurface contamination.

2.0 INTRODUCTION

LE Environmental LLC of Waterbury, Vermont (LEE) conducted a Phase I Environmental Site Assessment (ESA) of Brattleboro Town Parcel ID #80026.000, the Neenah Paper Manufacturing facility at 161 Wellington Road, Brattleboro, Windham County, Vermont 05301 (property; see Appendix A). The ESA was conducted pursuant to the American Society of Testing and Materials (ASTM) Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM E 1527-13).

This assessment was conducted for the Brattleboro Development Credit Corporation of Brattleboro, Vermont (BDCC). The property owner of record as of the date of this report is Fibermark Office Products, LLC.[1] The document users include BDCC, Long Falls Paperboard, LLC, the Vermont Agency of Commerce and Community Development, and People's United Bank.

2.1. Purpose

The purpose of this ESA was to identify recognized environmental conditions (RECs), historic RECs and de minimis conditions in association with the property as defined and described in the ASTM standard.

2.2. Detailed Scope-of-Services

LEE was engaged by client to conduct a Phase I ESA as defined in ASTM E 1527-13. The Phase I ESA work scope included the following elements:

- A general description of the site and vicinity, current property and adjoining property uses, and/or description of improvements.
- An evaluation of user supplied information including land records, liens, limitations, specialized knowledge, and valuation information.
- A review of practically reviewable regulatory and historic records in connection with the property.
- A site reconnaissance including general site setting, interior and exterior observations.
- Interviews with owner, site manager, occupants, local government officials and others as available.
- Presentation of Findings, Opinion, Conclusions, Deviations and the results of any out of scope contract obligations between client and LEE.

No invasive environmental testing was conducted, and no assessment or testing of asbestos, lead paint, radon or other structural environmental hazards was conducted.

[1] Brattleboro Land Records V. 409, Pg. 341.

3.0 SITE DESCRIPTION

3.1. Location and Legal Description

The property consists of a 39.52-acre parcel with a paper manufacturing facility at the north end of Wellington Road in Brattleboro, Vermont[2] (see Appendix A).[3] The center of property coordinates are 42° 53' 22.34'' north latitude and 72° 32' 34.28'' west longitude.[4] The town land records indicate that the property was owned by a succession of individuals through 1958, and then BDCC acquired the property for development as a paper mill. The property was sold by BDCC in 1960, and has been owned by a number of corporate entities since (Section 4).

3.2. Site and Vicinity General Characteristics

The property is at the eastern edge of the Brattleboro Industrial Zone, which encompasses most of the area east of Putney Road and north of I-91 Exit 3 (Appendix A). Development in this zone includes industrial manufacturing, warehouses, retail and wholesale distribution. The property's location between much of this development and the Connecticut River suggests that the property may be hydraulically downgradient from much of it.

The property is situated on a flat alluvial terrace overlooking the Connecticut River, and approximately 70 feet higher than the river.[5] The soils beneath the property consist predominantly of sand and gravel according to the 1990 subsurface investigation.[6] No natural bodies of water were observed on the property. No exposed bedrock was noted, although snow partially obscured the ground surface during the Site reconnaissance.

Depth to groundwater was approximately 70 feet below grade during previous Site investigations. The groundwater flow direction beneath the property was estimated to be northwesterly in 1990 and easterly in 1994. The groundwater flow direction may be influenced by the Connecticut River elevation and may be subject to inversion at times.[7] The depths to groundwater and flow direction were not confirmed during this Phase I ESA.

3.3. Current Use of the Property

The property hosts an approximately 200,000 square foot fully operational paper manufacturing plant employing approximately 100 people. The plant obtains pulp

[7] Griffin, 1990 and 1994.

and recycled paper from outside sources and produces 7-ply hard stock finished product. The property also includes a wastewater treatment plant for process water, a water filtration plant for process water, and an agricultural field that has been leased to area farmers in the past.

3.4. Descriptions of On-Site Structures, Roads and Other Improvements

Three structures designed for occupancy were identified on the property. These include the paper plant, the wastewater treatment plant, and the sand filter house.

Paper Plant

The main paper plant is an approximately 200,000 square foot concrete and metal building structure with a partial basement and partial second floor. The first building (main plant) was constructed in 1960, with additions to the building in 1967, 1973, 1974, 1978, 1982 (shipping area expansion and rail shed addition), 1988 (eastern warehouse addition), 1996 (second story offices and sand filter house), and 1998 (hazardous material storage room).[8]

The building houses equipment and supplies for processing pulp and recycled paper into 7-ply hard stock. The process flow in the building is from north to south. Raw materials are received and stored in the north end, and finished product is shipped out the south end. In between are machinery, infrastructure, supplies and equipment for wet end operations (slurry mixing, spreading, dewatering, rolling) and dry end operations (binding, finishing, embossing/glazing, packaging and warehousing). Pulping is not performed at the property. Bleaching is not currently performed on the property, although bleaching was performed in the 1960s and the 1970s.[9]

Pulp created elsewhere, along with recycled paper stock, is mixed with water to create slurry in several vats near the south end of the plant. The slurry is conveyed to a papermaking machine that dewaters the slurry. The process incorporates higher quality fiber on the finish surfaces and lesser quality fiber for the internal layers. The individual layers are rolled together to create the final product, which then is cut, finished, embossed/glazed and packaged for shipment.

The process as described consumes substantial quantities of water (greater than 1 mm gallons per day), which is mixed with pulp and recycled paper to form slurry. Most of this water is pumped from the Connecticut River, which is treated in the Sand Filter House prior to use. Two wells on the property serve as a backup supply of process water, and the facility is also connected to the Brattleboro town water system.

[8] Ramboll Environ, 2015.
[9] Ramboll Environ, 2015.

Much of the water is liberated during the dewatering / rolling process as liquid water and steam. The liquid water is released onto the floor of the plant, where it is conveyed via floor drains and downspouts to the basement and into the floor sumps, which drain to the on-site wastewater treatment facility.

The building includes the production facility, along with a maintenance shop, parts warehouse, boiler room, raw materials storage area, finished product warehouse, an office building and laboratory, and a shipping area and loading docks. There are roof top electrical transformers as well as electrical transformers within the building and an electrical substation on the east side of the building.

Outside of the building and proximal are several facilities including a compressed natural gas facility that provides fuel for building and process heat, a hazardous materials storage area, a fuel oil underground storage tank (UST) area that also includes a diesel above ground storage tank (AST), a covered rail spur with several railroad box cars that are currently used for dry parts storage, and an electrical substation.

Wastewater Treatment Plant

The wastewater treatment plant includes four aerated treatment lagoons and a clarifier. The lagoons are approximately 160 feet wide each and are oriented parallel to the Connecticut River. Influent is conveyed to the wastewater treatment plant via pipe and the effluent is discharged to the Connecticut River. The clarifier is a large (75 foot diameter) cylindrical tank adjacent to a cinder block building that houses a sludge conveyor, wastewater effluent treatment monitoring equipment, and chemicals. The clarifier building is approximately 30 feet wide and 45 feet long and is two stories tall. Approximately 30 cubic yards of wastewater sludge were stockpiled next to the clarifier at the time of the site reconnaissance.

Sand Filter House

The sand filter house is a single-story cement block building approximately 20 feet wide and 40 feet long. It was built in 1996 to treat process water from the river. It houses a disinfection unit (sodium hypochlorite) stored in a vertical AST, and six large steel tanks containing sand for filtration. The sand filter house is located directly across the access road from the clarifier building. Sand is periodically removed from the filters and is drummed for disposal. Drummed sand awaiting disposal is stored outside the north end of the paper mill building.

Three smaller structures were also identified but were not inspected due to confined space issues: the subsurface vault associated with the process water supply system; the subsurface vault associated with the main connection to the Brattleboro wastewater system; and, the water intake structure at the river's edge. None of these is anticipated to contain petroleum products or hazardous substances.

3.5. Current Uses of Adjoining Properties

Current uses of the adjoining properties were observed as follows:

- North: undeveloped woodland.
- East: Connecticut River.
- South: Green Mountain Power substation, Wellington Road.
- West: (south to north): Suburban Propane; BDCC Business Park (multi-tenant, former Book Press), C&S Wholesale Grocers, Closed Windham Solid Waste Management District (WSWMD) Landfill.

4.0 USER SUPPLIED INFORMATION

4.1. Title Records

LEE reviewed chain of title information recorded with the Brattleboro Town Clerk's office on November 27, 2018. A tabular summary of the property ownership history is included in Table 4-1.

Table 4-1

Grantor	Grantee	Book	Page	Date
Fibermark[10]	Fibermark Office Products, LLC	409	341	12/31/1997
Boise Cascade Corporation[11]	Specialty Paperboard, Inc.	211	901	6/30/1989
Case Brothers, Inc.[12]	Boise Cascade Corporation	121	646	9/30/1968
Brattleboro Development Credit Corporation	Case Brothers, Inc.[13]	105	2	8/8/1960
Robert Allard[14] Ruth Allard	Brattleboro Development Credit Corporation	101	573	12/31/1958
Alfred Chickering[15] Marion Chickering	Robert Allard Ruth Allard	93	565	12/31/1953
Ralph Peliter Pauline Peliter	Alfred Chickering Marion Chickering	91	278	1/1/1951

[10] Fibermark was formerly known as Specialty Paperboard, Inc.
[11] Deed conveys two parcels of land; the property is Parcel 1.
[12] Certificate of Merger.
[13] A corrective deed filed at V. 105 Pg. 273 amended the grantee's name to Case Brothers, Incorporated.
[14] Deed references part of land conveyed.
[15] Deed references part of land conveyed.

Recorded maps at the Brattleboro Town Clerk's office were found including the following. Copies of these maps are included in Appendix A.

- A 1989 property survey showing the entire property, the building and water treatment system.[16]
- A 1980 map showing the building's septic system.[17]
- A 1959 property survey showing the property undeveloped, except for a utility line.[18]

Recorded documents related to USTs at the property were found, summarized as follows.

- A Vermont Notification for Underground Storage Tank form filed by Boise-Cascade.[19]
- A Vermont Notification for Underground Storage Tank form filed by Specialty Paperboard.[20]

Vermont Act 250 Land Use Permits recorded in the Brattleboro Town Land Records authorized the following construction on the property:

- Construction of a 1,900 square foot addition to the existing facility to be used for bulk commercial storage.[21]
- Construction of a compressed natural gas unloading station including utilities. [22]
- Placement of 350 cubic yards of riprap along an approximately 200-foot length of the Connecticut River shoreline to control erosion.[23]

Various easements and liens were found in the Brattleboro Town Land Records filed under Fibermark, Boise Cascade, and Case Brothers. These were examined and none were found to be of an environmental nature.

4.2. Environmental Liens or Activity and Use Limitations

No environmental liens or activity and use limitations were discovered during review of land records. The Class IV groundwater designation for the north end of the property is not filed in the property owner's names. Users were not aware of the existence of environmental liens or activity and use limitations in connection with the property.

[23] V. 275, Pg. 949, 8/11/1999.

4.3. Specialized Knowledge

Users have no specialized knowledge of the property other than its use as a paper manufacturing facility, as designed, with no other known uses.

4.4. Commonly Known or Reasonably Ascertainable Information

Users are aware of the findings of the previous Phase I ESAs, including the existence of a #6 fuel oil plume, basement sumps, current and former septic tanks

4.5. Valuation Reduction for Environmental Issues

Users indicated that the purchase price seems to be accurate and to represent a market valuation, with no apparent reduction to valuation reduction for environmental issues.

4.6. Owner, Property Manager, and Occupant Information

Users identified the property owner, manager and occupants as Neenah Northeast LLC.

4.7. Reasons for Performing Phase I

Users indicated that this Phase I ESA is being performed to provide environmental due diligence in connection with a planned acquisition. BDCC is planning to purchase the property and Long Falls Paper LLC is planning to acquire the machinery.

4.8. Other User Supplied Information and Documentation

Users provided a previous Phase I ESA report, which is summarized in Section 5.2 of this document.[24]

[24] Ramboll Environ, 2015.

5.0 RECORDS REVIEW

5.1. Standard Environmental Record Sources

5.1.1 Regulatory Database Search

LEE contracted with Environmental Data Resources, Inc. (EDR) to perform a review of state and federal regulatory records during this Phase I ESA. A copy of the EDR Report is included in Appendix F. A summary of the pertinent data contained in the EDR report is presented below.

Property

The property is included in the EDR report for the following searched environmental database categories:

Vermont Tier 2 (as Fibermark North America Inc., 2006-2010, Neenah Northeast LLC 2011-2017): the database listings of industrial chemicals stored on the property included:

- Organic reagents (diethanolamine, cyclohexylamine, 1-methyl-2-pyrrodone, potassium dodecylbenzene suphonate, dipropylene, ethyl acrylate, 2-propanol, 2,2-dibromo-3-nitrpropionamide. These substances are in use as biocides and process reagents.
- Elemental gasses (nitrogen and argon)
- Petroleum products (#6 fuel oil, lubricating oil, diesel fuel, propane, compressed natural gas, hydraulic oil).
- Inorganic process reagents (diammonium orthophosphate, aluminum sulfate, copper-based pigment, ammonia, carbon black).
- Acids and bases (acetic acid, sulfuric acid, sodium hydroxide, potassium hydroxide).

EPA Watch List: the property (as Fibermark North America) was included on the EPA Watch List for Clean Water Act (CWA) facilities from April through August 2013. The facility ID # was VT0000248. No further information was provided.

FIFRA/TSCA Tracking System database (FTTS/Hist FTTS): The property (as Fibermark) is included on the FTTS and the Historic FTTS database due to a Federally conducted Section 6 PCB investigation performed in 2003.

Vermont AST (above ground storage tank) Registry (as Fibermark North America, Inc.): the AST registry includes a listing for the property; however, no further information was provided.

PCB Transformer (as Fibermark): this database notes the presence of three PCB transformers on the property.

Vermont Reported Spills List (as Fibermark North America, Inc.): the EDR Report includes a reported spill (Reference 2017 WMD281) that took place on June 14, 2017. A blown hose on a paper machine caused a release of 50 gallons of an unspecified substance. The substance drained to the floor drains and the clarifier and booms were deployed in the wastewater system to prevent discharge outside the wastewater system. The spill file was closed on June 19, 2017.

Asbestos Registry (as Neenah Inc. and Fiber Mark): Asbestos abatement was performed in May 2018. Eight linear feet of asbestos containing material was removed and disposed of at a Pennsylvania landfill. Asbestos abatement was performed from January – April 2018. 898 square feet of asbestos containing material was removed and disposed of at the Minerva Landfill. Asbestos abatement was performed in January 2015. Two linear feet of asbestos containing material was removed and disposed of at an unspecified location.

Vermont Manifest: Hazardous waste manifest data indicates a substantial number of shipments of hazardous waste from the facility for the period from 2006 - 2015. The materials shipped included non-DOT RCRA hazardous liquids, Non-DOT regulated oil and oily water, state-regulated solid waste oily debris, RQ waste paint related material, antifreeze, waste oil, oil filters, sorbents and oil, and combustible liquids (petroleum naphtha).

Vermont UST Registry (as Neenah): the Vermont UST registry includes the property as an active UST facility (Facility ID#1020). The registry indicates the following information:

- Two, 25,000-gallon fuel oil USTs were installed in 1962 and were removed in 1990. The USTs were reported to be leaking upon removal.
- One, 4,000-gallon diesel fuel UST was installed in 1974 and was removed in 1988, in reported poor condition.
- One, 2,000-gallon gasoline UST was installed in 1974 and was removed in 1988, in reported good condition.
- One, 1,000-gallon gasoline UST was installed in 1974 and was removed in 1988 in reported poor condition.
- Two, active 25,000-gallon fuel oil USTs are registered at the property, containing #6 fuel and/or waste vegetable oil. The USTs were installed in 1990 and are protected steel with impressed current, spill containment and overfill alarms.

Toxics Release Inventory System (TRIS)(as Neenah Northeast LLC): this database indicates that the facility uses toxic chemicals and has notified EPA under SARA Title

III, Section 313. The toxic substances are reported to be polycyclic aromatic compounds.

RCRA LQG (Large Quantity Generator) database (as Neenah Northeast LLC): this database indicates that the facility generates 1,000 kilograms or more of hazardous waste during any calendar month. The indicated start date is June 1, 1989. The waste types include ignitable wastes, chromium, lead, benzene, tetrachloroethylene, trichloroethylene, VT01, VT02, VT08, and VX 51. The facility has received notices of violations in 1991, 1996, 2000, 2005, 2013, and 2016.

Leaking UST Database (as Specialty Paperboard): This database indicates that the property is Vermont DEC Site #90-0482, with Sites Management Activity Complete (SMAC) status. A gasoline UST is listed in the EDR report as the source. Fuel oil was solidified, with state groundwater enforcement standards met. The closure date is November 1, 1994.

Adjoining Properties

Adjoining properties were included in the EDR report as follows.

Suburban Propane at 96 Wellington Road (adjoining to the south) is included in the EDR report as an AST registry site, and a Vermont Tier 2 location. The ASTs are for propane storage and the Tier 2 listings include Methylol and propane.

The Brattleboro Business Park at 22 Browne Court is a multi-tenant facility that used to be the Book Press facility. It is an adjoining property to the west. This property is included in the EDR report for the following databases:

- Vermont UST registry: The UST registry data is in the name of the BDCC, the adjoining property owner. An active 10,000-gallon fuel oil UST is present on the adjoining property at 22 Browne Court. It was installed in 2006 and is a polyethylene jacketed steel UST with interstitial monitoring. Seven USTs were removed from this site, summarized as follows:
    - A 1,000-gallon gasoline UST installed in 1971 and removed in 1992, reportedly in leaking condition.
    - A 10,000-gallon diesel fuel UST installed in 1972, removed in 1993, in reported fair condition.
    - A 13,000-gallon fuel oil UST installed in 1972, removed in 2000, in reported good condition.
    - A 10,000-galon fuel oil UST installed in 1972, removed in 2006, in reported good condition.
    - A 1,000-gallon alcohol blend UST installed in 1972, removed in 1992, in reported fair condition.
    - A 275-gallon kerosene UST installed in 1972, removed in 1992, in reported fair condition.

  - A 500-gallon hazardous substances UST installed in 1972, removed in 1992 in reported leaking condition.
- RCRA-CESQG database: Bradford Machine Company at 22 Browne Court, Unit 104, is a RCRA Conditionally-Exempt Small Quantity Generator of Hazardous Waste (CESQG), handling less than 100 kilograms per calendar month and accumulating 1000 kilograms or less at any time. The reported waste types include ignitable wastes, carbon tetrachloride, tetrachloroethylene, and trichloroethylene. No violations have been reported.
- The Book Press is included on the DEC's Leaking UST list (DEC Site #93-1461). The site status is no further action planned.
- The Book Press Club is a USEPA Brownfields Site. The Windham Regional Commission conducted a Phase I ESA in 2002 using USEPA Brownfields Assessment funds. A Phase II ESA was not performed.

C&S Wholesale Grocers on Old Ferry Road (adjoining to the west) is included in the EDR report for the following database categories:

- Vermont UST Registry: Four USTs were removed from the C&S site in 1992. These included:
  - A 500-gallon lubricating oil UST installed in 1980, removed in reported good condition.
  - Two 10,000-gallon diesel fuel USTs installed in 1980, removed in reported good condition.
  - A 10,000-gallon gasoline UST installed in 1980, removed in reported good condition.
- Vermont Reported Spills List: the C&S site had a reported 100-pound spill of anhydrous ammonia refrigerant in March 2013. No cleanup could be performed. The spill file was closed in March 2013.
- Vermont Leaking UST list (DEC Site #92-1258): The reported source is a gasoline UST. The project status indicates that soils were stockpiled, soil treatment is continuing and the site is low priority with contamination of soil or groundwater and no effect on sensitive receptors.

The Penske Truck Leasing Company at 54 O'Brian Drive (co-located with C&S Wholesale Grocers) is included in the EDR report as a Vermont UST registry site, a leaking UST site, a reported spill site, a RCRA non-generator, a hazardous waste manifest site, and an EPA Finds/ECHO database site.

- Vermont UST registry: Three USTs were removed in 2008. These include:
  - A 2,000-gallon used oil UST, removed in reported excellent condition.
  - A 12,000-gallon diesel UST, removed in reported good condition.
  - A 10,000-gallon diesel UST, removed in reported good condition.
- The leaking UST database (DEC Site #2009-3895) indicates that a diesel fuel release was discovered during the UST removals. Approximately 400 cubic yards of contaminated soil were removed and only minor contamination

remained. No groundwater impacts were noted. The site received SMAC status in May 2009.

- The Site had a reported 30-gallon diesel fuel spill in 1999 due to a punctured fuel tank. The Brattleboro Fire Department and a contractor responded to the spill. The spill file was closed in 1999.
- The RCRA non-generator information indicates that as of November 2015, hazardous wastes were not generated at this location. Previously, the Site was a CESQG with waste generated including ignitable wastes, benzene, and pentachlorophenol from 1995 to 2015.
- Hazardous waste manifest data for this site indicated that combustible liquids (naphtha) was shipped from 2007 to 2015.

The WSWMD Landfill at 327 Old Ferry Road (adjoining to the west) is included in the EDR report for the following database categories:

- Solid Waste Facility: The facility ID# WH083 for an integrated waste management facility. The facility is fully certified for operations as a waste transfer station.
- Vermont Manifests: The facility has shipped hazardous waste under manifest. The shipment dates were 2007 to 2010. The wastes shipped included pesticides, corrosive liquids, used fuel oil, antifreeze, latex and oil based paints, nickel cadmium batteries, oily wastes, sodium hydroxide, and sodium cyanide.
- RCRA Non-Generator/ Historical Generator: The facility is included on the RCRA non-generator and historical waste generator list for ignitable wastes, corrosive wastes, arsenic, barium, cadmium, chromium, lead, mercury, selenium, silver, benzene, methyl ethyl ketone, non-halogenated solvents, pesticides and various organic compounds. Non-generator status was certified in 2007. Historical generator status ran from 2000-2005.

Other Sites

There are a number of other area properties that appear in the EDR report for one or more of the searched environmental database categories. LEE reviewed the database listings for several of these, including the former Vantem Panel property at 74 Glen Orne Road, Entergy/Vermont Yankee Nuclear Power building at 185 Old Ferry Road, UPS Brattleboro at 8 O'Brian Drive, and Brattleboro Agway at 1277 Putney Road. It was determined that these sites present minimal risk to the property based on the information contained in the EDR report.

5.2. Additional Environmental Record Sources

LEE checked the Vermont Agency of Natural Resources (ANR) Atlas Waste Management Database and confirmed that the property is not on ANR's list of landfills, land use restrictions, active hazardous waste sites, Brownfields, salvage

yards, or dry cleaners. A map generated from the ANR Atlas showing the property and surrounding properties, and nearby hazardous waste sites, brownfields sites, solid waste sites, UST sites, and dry cleaning sites is included in Appendix A.

The ANR database indicates that the groundwater beneath the northern portion of the property has been reclassified to Class IV (non-potable) under the Vermont Groundwater Rule. A map generated from the ANR Atlas showing the reclassified groundwater zone is included in Appendix A.

DEC UST Registry File

LEE reviewed the UST registry file for the property. The file contains numerous documents, relating to two existing fuel oil USTs, two removed fuel oil USTs, two removed gasoline USTs, and a removed diesel fuel UST.

a) Notification was made on March 31, 1986 to the DEC of two, 25,160-gallon #5/#6 fuel oil USTs at the property. The USTs were reported to be 24 years old at the time, installed in 1962. The USTs were in use at the time. They consisted of single-wall steel USTs with black iron piping. No secondary containment, internal or external protection or leak detection devices were reported. The UST locations were east of the mill boiler room in the center of the industrial plant site.
b) Notification was made on March 31, 1986 to the DEC of a 2,000-gallon gasoline UST, a 1,000-gallon gasoline UST, and a 4,000-gallon gasoline UST at the property. The USTs were reported to be 12 years old at the time, installed in 1974. The USTs were in use at the time. They consisted of single-wall steel USTs with black iron piping. No secondary containment, internal or external protection or leak detection devices were reported. The UST locations were described as north of the Krofts building, which was south of the #6 oil USTs.
c) Three USTs were removed on June 2, 1988. These included a 1,000-gallon gasoline UST, a 2,500-gallon gasoline UST, and a 4,000-gallon diesel fuel UST according to the UST removal report. The conditions of the 1,000-gallon and the 4,000-gallon USTs were "rusted" and the 2,500-gallon UST was described as "good". A DEC inspector oversaw the UST removals. No indication was provided whether contamination was present in the ground during the UST removals. The initial priority was indicated to be "low/closed."
d) Two USTs were removed on February 1 and 2, 1990. These included two, 25,000-gallon #6 fuel oil USTs according to the UST removal report. The conditions of the USTs were described as leaking. A DEC inspector oversaw the UST removals. Contaminated soils were estimated to be 500 cubic yards, which were left in the ground. The initial priority was indicated to be "medium."
e) Notification was made on May 16, 1990 to the DEC of the existence of 2, 25,000-gallon #5/#6 fuel oil USTs at the property. The USTs were installed

in 1990. The USTs were in use at the time. They consist of steel double walled USTs with cathodic protection and aboveground black iron piping.

f) Various operating permits and documentation of changes to the permit ownership were also included in the UST registry files.

DEC Hazardous Sites File

LEE reviewed the DEC's Hazardous Sites file (inactive) for the property. The following documents were reviewed:

a) Subsurface Petroleum Investigation Report:[25] This report describes the initial Site investigation that took place following the discovery of contamination related to the #6 fuel oil UST removals in 1990.
    a. Four soil borings were advanced at and near the location of the removed fuel oil USTs. Heavy petroleum contamination was detected from 8-47' depth.
    b. Groundwater monitoring wells were installed, and groundwater was found approximately 70' below grade.
    c. Groundwater contamination was found including petroleum-related volatile organic compounds (VOCs), total petroleum hydrocarbons, and chlorinated VOCs (cVOCs).
    d. The petroleum-related VOCs included benzene, ethylbenzene, toluene, xylenes, and MTBE, a gasoline additive. The reported benzene concentration exceeded the drinking water MCL in effect at the time.
    e. The cVOCs included tetrachloroethene (PCE), trichloroethene (TCE), 1,1,1-trichloroethane, trichlorofluromethane, vinyl chloride, 1,1-dichloroethane, 1,2-dichoroethane, and trans-1,2-dichloroethene. The reported PCE and TCE and vinyl chloride concentrations exceeded the drinking water MCLs in effect at the time.
    f. Groundwater was estimated to be flowing northwesterly, away from the Connecticut River.
    g. The report indicated that as of 1990, the mill was not using chlorinated solvents in its manufacturing processes, but that prior to 1988, small amounts were used in various maintenance procedures and that the chlorinated solvent contamination may be attributable to these historic practices.
    h. The report attributed the petroleum VOC contamination to a gasoline UST in the vicinity, which was removed a few years earlier.
    i. The report confirmed that there was a release of #6 heating oil due to a leak in one of the two removed USTs. The majority of the contamination was contained in the unsaturated zone above the water table. However, some of the oil reached the water table.
    j. The report recommended additional investigations and cleanup of the fuel oil contamination.

[25] Griffin, July 1990.

b) Groundwater Sampling Report:[26] This report describes the results of monitoring in September 1994, and requested SMAC status.
    a. Ten monitoring wells were gauged and sampled.
    b. Free product (floating oil) was detected in three wells in the vicinity of the removed USTs. It was described as extremely viscous to nearly solidified.
    c. Groundwater flow was estimated to be easterly toward the Connecticut River.
    d. MTBE was the only petroleum VOC detected in the groundwater samples, in one well (MW-11) at a concentration below the health advisory standard in effect at the time.
    e. Chlorinated VOCs were detected in groundwater. This contamination was attributed to past storage and handling of chlorinated solvents in the maintenance shop vicinity. The detected cVOCs included PCE, 1,1,1-trichloroethane, and trichlorofluromethane, concentrations of which were reportedly less than health advisory and drinking water standards in effect at the time. All of the reported concentrations were below current Vermont Groundwater Enforcement Standards.
        i. Groundwater in the vicinity of one monitoring well (MW-12) westerly of the facility contained detectable concentrations of trichlorofluoromethane and 1,1,1-trichloroethane (1,1,1-TCA).
        ii. Groundwater in the vicinity of five monitoring wells (MW-1, -2, -4, -10 and -14) in the vicinity of the removed USTs contained trichlorofluoromethane.
        iii. Groundwater in the vicinity of four monitoring wells (MW-1, -2, -4 and -10) in the vicinity of the removed USTs contained PCE.
        iv. Groundwater in the vicinity of five monitoring wells (MW-1, -2, -10, and -14 in the vicinity of the removed USTs contained 1,1,1-TCA.

c) Sites Management Activity Complete Letter:[27] This letter acknowledges the 1994 monitoring report and SMAC request, and states that contaminant concentrations are below applicable Vermont Groundwater Enforcement Standards.

DEC Spills Database

LEE reviewed the DEC Spills Database. The database indicated the following reported spills took place on the property. All of the spills were reported as "Specialty Paperboard" except the 2017 spill. All of the spill files have been closed by the DEC.

[26] Griffin, October 1994.
[27] DEC, 1994.

Table: Reported Spills Database				
Date Reported	Spill #	Amount (gallons)	Substance	Date Closed
12/17/1991	1991-280	200	Oil	12/18/1991
4/25/1992	1992-101	20	Not specified	4/27/1992
12/23/1992	1992-346	4,000	#6 fuel oil	7/2/1995
3/15/1994	1994-WMD066	1	Hydraulic oil	3/15/1994
12/24/1995	1995-WMD383	1,000	Wastewater overflow	12/26/1995
6/14/2017	2017-WMD281	50	Hydraulic Oil	6/19/2017

Previous Phase I ESA Reports

LEE reviewed the 2015 Phase I ESA report for the property. This report contains four earlier reports pertaining to the facility that were prepared in 2007, 2003 and 1980. The standards to which the earlier reports were written varied considerably, as did the findings, conclusions and recommendations in each report. Pertinent findings presented in the 2015 Phase I ESA report are summarized as follows:

- The documented residual contamination from the #6 fuel oil spill discovered in 1990, which received SMAC status in 1994, was classified as a Controlled REC in the 2015 Phase I report.
- Basement sumps and the current and former septic tanks were classified as "other findings" in the 2015 Phase I report.
- A former unconfirmed UST and a former unconfirmed waste oil release were classified as "other findings" in the 2015 Phase I report.
- The 2015 Phase I report did not address the former gasoline and diesel USTs removed in 1988.
- Potential migration from off-site properties was classified as "other finding" in the 2015 Phase I report.
- Stressed vegetation on the west side of the wastewater lagoons was considered to be an "other finding in the 2015 Phase I report.
- The outdoor equipment storage yard was classified as "de minimis" in the 2015 Phase I report.
- PCBs containing transformers were not classified in the 2015 Phase I ESA report.
- A 1992 spill of #2 fuel oil during transfer was classified as an historical REC in the 2015 Phase 1 report.

Other notable findings from the earlier Phase I ESA reports are summarized as follows.

- The 2015 Phase I ESA contains the following information: [28]

[28] Ramboll Environ, 2015.

- Petroleum Releases. According to the EDR database report, several reported petroleum spills occurred at the site in the 1990s. As each of these incidents has been closed for more than 20 years, these historic spills were classified as HRECs.
- *"The basement sumps in the main building receive dyes, adhesives, cleaners, oils, paper slurry, and process water from floor drains in the production areas. Pools of standing liquid are present throughout the basement. Because of the lack of integrity testing and regular inspections of the floor drains and sumps, cracks in the sump may allow contaminants to reach the subsurface. According to Company personnel, FiberMark does not routinely conduct integrity inspections on the sumps and associated floor drains, and there has been no regulatory scrutiny related to basement sumps."*
- *"From the early 1970s to 2001, the majority of the facility's sanitary wastewater discharged to a septic system located on the east side of the main building, adjacent to the employee parking area. Although the septic system was decommissioned in 2001, the two septic tanks remain connected to the Brattleboro sanitary sewer as pass-through units. No soil sampling was conducted during the removal of the associated leach field. Based on a 1959 site plan reviewed at the Brattleboro Public Works Department, a previous septic system had originally operated between 1960 and the 1970s in a similar location to this more recently decommissioned septic system. The facility currently operates one septic system that has been receiving sanitary wastewater from restrooms and laboratory sinks at the north end of the main building since 1973. In addition to sanitary wastewater, the septic systems also have received discharge from laboratory sinks and possibly from the maintenance area floor drain, whose discharge location is unknown. Because chlorinated solvents may have been used historically in small quantities in the laboratory or maintenance areas, there is the potential for soil or ground water impacts in the vicinity of the former or current septic systems. Groundwater testing conducted in 1994 detected low levels of chlorinated hydrocarbons on-site, but none of the samples was collected near the on-site septic systems."*
- *"Ramboll Environ observed an approximately 150-square foot area of stressed vegetation on the northwest side of the wastewater treatment lagoons. The area of stressed vegetation was covered in what appeared to be moss and surrounded by grass. Several metal stakes were noted around the perimeter of the stressed area. Facility personnel did not have any information relative to this area and were unaware of a cause for the stressed vegetation."*
- *"According to facility personnel, the facility has operated as a manufacturer of paperboard since it was constructed. Although no primary pulping is known to have occurred on site, in the 1960s, the facility used a color stripping process that involved intermittent bleaching of colored recycled fiber. According to facility personnel,*

sodium hypochlorite bleach (10-15%) was stored in a 5,000-gallon bleach tower and directly added to slurry in the pulpers. This color stripping process was discontinued in the 1970s."

- A 2007 Phase I ESA Report contains the following information:[29]
  - *"According to EDR, a release of waste oil was discovered at the subject property on December 1, 1996. The release threatened a sensitive receptor. On October 10, 1997, the Vermont DEC sent a letter to Specialty Paperboard requesting a work plan to address the release. As of April 1998, no response had been received by the DEC. Facility personnel were unaware of a waste oil release."*[30]

WSWMD Groundwater Monitoring Reports

LEE reviewed the 2017 groundwater monitoring report for the WSWMD closed landfill (adjoining to the northwest).[31] Maps contained in this report indicate that the following monitoring wells associated with the WSWMD landfill are located on the property, along with water quality observations for those points:

a) AQ-03A, -03B, -03SBR, -03DBR: This monitoring well cluster is located at the southeast corner of the cornfield. These wells have not been sampled since 2011.
   a. Water quality data indicate that arsenic, barium, chloride, chromium, chemical oxygen demand (COD), copper, iron, lead, manganese, nickel, selenium, sodium, and zinc were detected. The reported concentrations of COD, iron, and manganese exceeded groundwater enforcement standards on one or more monitoring dates, including the last sampling date in 2011.
   b. Water quality data indicate that petroleum VOCs (benzene, toluene and MTBE), cVOCs (1,1-dichloroethane, 1,1-dichloroethene, 1,1,1-trichloroethane, cis-1,2-dichloroethene) and acetone, chlorobenzene, diethyl ether, methylene chloride, and trichlorofluoromethane were detected. The reported concentrations of benzene and methylene chloride exceeded groundwater enforcement standards at least once. Generally, the VOC detections took place prior to 2008.

b) MW-05, -05B, -05SBR, -05DBR: This monitoring well cluster is located on the east side of the cornfield, a few hundred feet north of AQ-3. These wells were not sampled in November 2017.
   a. Water quality data indicate that arsenic, barium, cadmium, chloride, chromium, COD, copper, iron, lead, manganese, mercury, nickel, selenium, sodium and zinc have been detected. The reported concentrations of COD, iron, and manganese exceeded groundwater

[29] Clayton, 2007.
[30] This situation appears to be a database error; see Section 7.4.
[31] KAS, 2017.

enforcement standards on one or more monitoring dates, including the last sampling date in May 2017.

b. Water quality data indicate that petroleum VOCs (benzene), cVOCs (1,1-dichloroethane, 1,1,1-trichloroethane, 1,2-dichloroethane) and acetone, 1,4-dichlorobenzene, chlorobenzene, diethyl ether, and methylene chloride have been detected. The reported concentrations of benzene and methylene chloride exceeded groundwater enforcement standards at least once. Generally, the VOC detections took place prior to 2004.

c) MW-4a: This monitoring well is located on the northwest side of the property and north of the cornfield. This well was not sampled in November 2017.

a. Water quality data indicate that arsenic, barium, cadmium, chloride, chromium, COD, copper, iron, manganese, nickel, sodium and zinc have been detected. The reported concentrations of arsenic, COD, iron, and manganese exceeded groundwater enforcement standards on one or more monitoring dates, including the last sampling date in May 2017.

b. Water quality data indicate that 1,1-Dichloroethane, 1,2-Dichlorobenzene, 1,2,4- and 1,3,5-trimethylbenzene, 1,4-dichlorobenzene, acetone, benzene, chlorobenzene, diethyl ether, ethylbenzene, isopropyl benzene, and naphthalene were detected. The reported concentrations of naphthalene, benzene and methylene chloride exceeded groundwater enforcement standards at least once. Generally, the VOC detections took place prior to 2004 although detections of chlorobenzene continued to take place through the last sampling in May 2017.

d) There are also notations on the site map to MW-3A and MW-9 being on the property, however, the groundwater monitoring report contains no data correlating to these monitoring well locations.

LEE reviewed the testing results for perfluorinated compound (PFC) testing in groundwater and drinking water from the WSWMD landfill.[32] The sampling was performed in December 2016, and included two groundwater monitoring wells and two drinking water supply wells. PFCs were reported in both groundwater samples at concentrations below DEC's groundwater enforcement standards for PFCs in effect in 2016, and those in effect in 2018. No PFCs were reported in the drinking water samples collected in December 2016. The reporting limits of the analysis were below the DEC's groundwater enforcement standards for PFCs.

[32] KAS, 2016.

BDCC Business Park (Former Book Press)

LEE reviewed several documents related to petroleum contamination at the former Book Press facility (adjoining to the west). The documents included a DEC First Letter,[33] a site investigation report,[34] and a SMAC letter.[35]

- The DEC First Letter indicates that five USTs were removed in 1992 and two of the USTs were reportedly leaking. These included a 1,000-gallon gasoline UST and a 500-gallon naphtha UST. The letter required that a site investigation be performed.
- The site investigation report included advancement of eight soil borings in the area of the removed leaking USTs. Seven of the borings were advanced to 10' depth and one was advanced to 22' depth. No evidence of contamination was detected during the soil borings. No groundwater was encountered. Two soil samples submitted for laboratory testing did not contain detectable contamination.
- The SMAC letter confirmed the work that was performed and indicated that no further additional work is being required with respect to the removed USTs.

5.3. Maps

5.3.1 USGS Topographic Maps

USGS topographic quadrangle maps were reviewed during this assessment including the 2018,[36] 1984, 1954, 1935 and 1893 maps.[37] Copies of these maps are in Appendix A. The following observations were made.

- The 2018 USGS map does not depict building structures. It shows the property developed with the wastewater lagoons.
- The 1984 map shows the property developed with the paper plant and lagoons, and a separate structure located to the south of the paper plant in the approximate location of the current offices. Adjoining property development shows the rail line, the Book Press building to the west, and a small structure where Suburban propane is located. C&S Grocers does not appear on the 1984 map. Other structures appear along Old Ferry Road to the northwest. The landfill to the west is not designated as such on the map.
- The 1954 and 1935 maps show the property and the adjoining properties undeveloped except for the railway line.
- The 1893 map shows the property undeveloped, and adjoining properties appear undeveloped except for the rail line.

[33] Vermont DEC, 1993.
[34] ENSA, 1994.
[35] Vermont DEC, 1994.
[36] USGS Store.
[37] 1884, 1954, 1935 and 1893 maps provided by EDR and included in the 2015 Phase I ESA.

5.3.2 State Geological Maps

Bedrock at the south end of the property consists of Devonian-aged schist and metawacke of the Waits River Formation. Bedrock at the north end of the property consists of upper Ordovician-aged schist of the Partridge Formation. The overburden deposits in the area of the property are mapped as fluvial sands.[38]

5.3.3 Fire Insurance Maps

Sanborn insurance mapping is not available for the property. A no-coverage certificate is included in Appendix A.

5.4. Other Historical Use Information for the Property and Adjoining Properties

5.4.1 Standard Historical Sources

City Directory Information

LEE reviewed city directory listings for the property provided by EDR and included in the 2015 Phase I ESA report. These listings indicate that Wellington Road was listed in the 2008 and 2013 directories but not in the earlier directories. Listings along Wellington Road appear to be individuals, along with Suburban Propane.

Aerial Photographs

LEE reviewed aerial photographs of the property provided by EDR and included in the 2015 Phase I ESA report. The photos are for select years from 1951 to 2012. A summary of observations is as follows. Copies of the photos are in Appendix B.

[38] ANR Atlas.

Table 5-1: Summary of Air Photo Observations

Year	Observation
2012, 2011 2009, 2008 2006, 1998	Property and adjoining properties were developed approximately as seen in 2018. The WSWMD landfill was non-operational. Hummocky ground was notable at the north end of the cornfield on the 1998 photo.
1992	Photo resolution is not sufficient to make specific property observations, except that the property appears to be developed with the paper plant, lagoons and cornfield. The WSWMD landfill appears to be operational. Construction activities appear to be taking place on the adjoining property to the west where C&S Grocers is located.
1985	Photo resolution is not sufficient to make specific property observations, except that the property appears to be developed with the paper plant, lagoons and cornfield. The WSWMD landfill appears to be operational. Except for the Book Press building, adjoining property to the west appears to be wooded and undeveloped.
1977 1972	Property appears developed with the paper plant. The lagoons are not visible. There appears to be excavation activity at the north end of the cornfield. The WSWMD landfill appears to be operational. Except for the Book Press building, adjoining property to the west appears to be undeveloped.
1951	Property appears cleared and undeveloped and there appears to be excavation at the north end of the property. Adjoining properties appear to be in agricultural use. The WSWMD landfill site appears to host excavation as well.

5.4.2 Other Historical Sources

LEE reviewed a 1989 property survey.[39] The survey shows the property built out similar to that seen in 2018. Differences between the 1989 configuration and the current configuration include the 25,000-gallon fuel oil USTs that were removed and installed in 1990, the main leachfield east of the plant was operational, the CNG installation is not present, and the clarifier building is not present. There is a notation at the north end of the property, "Active Fill Area".

LEE reviewed a 1980 septic system encroachment plan.[40] The plan shows the main septic system as it existed then. A 2,000 gallon septic tank is shown outside the mill entrance. A "new" 2,000 gallon septic tank is shown east of the curb, along with a pump station and a 20' x 100' leaching bed. An area for expansion and replacement is shown to the north.

LEE reviewed a photo of a July 1961 Brattleboro Reformer article posted in the conference room at the property. This article shows the newly constructed plant as it existed when it began operations in 1961. A copy of the photo is included in Appendix B.

[39] ALTA/ASCM, 1989.
[40] New England Power Service Company, 1980.

LEE reviewed a 1958 property survey.[41] The survey shows the property undeveloped except for an overhead electric line running northerly in the current plant location, then westerly. A riverfront camp is shown on the adjoining property to the north. No structures are depicted on the property.

6.0 SITE RECONNAISSANCE

6.1. Methodology and Limiting Conditions

On November 28, 2018, Alan Liptak and Angela Emerson of LEE conducted a site reconnaissance to inspect the property for indications of environmental risks or hazardous conditions. A completed site inspection checklist is included in Appendix C. LEE was accompanied by Neenah representatives Robert Murphy and Punjan Tejani, and Vermont DEC representatives Patricia Coppolino, Kimberly Caldwell, and Shawn Donovan during the reconnaissance. Photographs of the property are included in Appendix B.

LEE inspected virtually the entire property, including the interior of the paper mill building, the clarifier building and the sand filter house, except for some office space, and outdoor structures not designed for occupancy (water pump house, water intake house, septic manhole) due to confined space entry issues. Following are summarized observations made during the site reconnaissance.

Hazardous Substances and Petroleum Products

Hazardous substances and petroleum products were noted throughout the paper mill building. Generally the storage of these substances was well-organized, with no spills or obvious releases noted. A summary of the hazardous substances and petroleum products noted inside the mill is as follows. The approximate maximum volumes of substances are based on tank volumes and Tier 2 information.

- Organic reagents (diethanolamine (300 gallons), cyclohexylamine (300 gallons), 1-methyl-2-pyrrodone (200 gallons), potassium dodecylbenzene suphonate (1,000 gallons), dipropylene (4,000 gallons), ethyl acrylate, 2-propanol, 2,2-dibromo-3-nitrpropionamide, glycerine (550 gallons). These substances are in use as biocides and process reagents.
- Elemental gasses (nitrogen and argon)
- Petroleum products (#6 fuel oil (50,000 gallons), lubricating and hydraulic oil (1,000 gallons), diesel fuel (500 gallons), propane (20,000 gallons), compressed natural gas).

[41] Hall and McChesney, Inc., 1958.

- Inorganic process reagents (diammonium orthophosphate (5,000 pounds), aluminum sulfate (5,500 gallons), copper-based pigment (300 gallons), ammonia (300 gallons), carbon black (500 gallons)), urea (3,000 pounds).
- Acids and bases (acetic acid (500 gallons), sulfuric acid (300 gallons), sodium hydroxide (2,000 gallons), potassium hydroxide (1,000 gallons)).

The #6 fuel oil is stored in two 25,000-gallon USTs on the east side of the plant. These USTs have interstitial monitoring and cathodic protection, with spill protection consisting of a bermed area around the fill ports.

Diesel fuel is stored in a 500-gallon steel AST in the same location as the #6 fuel oil USTs. The AST is double walled, but no spill containment was noted around the dispensing unit.

Propane is stored in an approximately 20,000-gallon AST at the south end of the clarifier. Compressed natural gas is stored inside box trailers that are replaced on an as-needed basis by NRG, the gas supplier.

Sodium hypochlorite is used to disinfect process river water, and is stored in a vertical AST inside the north end of the sand filter house.

Various aerosols were noted inside the maintenance shop, and are used to lubricate and cut various components. LEE did not observe chlorinated solvents inside the building.

A 100-gallon naphtha parts washer is present inside the maintenance shop. The parts washer appeared to be in good condition and no significant evidence of spillage was noted in its vicinity. Safety Kleen services the parts washer.

Underground and Above Ground Storage Tanks

Visual evidence of two USTs was observed. Two, 25,000-gallon USTs used to store #6 fuel oil for backup plant heat are registered to the property. There were other USTs on the property that were removed in 1988 and in 1990 but no visual evidence of these was noted.

There are numerous ASTs at the property, both inside and outside the buildings. A summary is as follows. All of the ASTs appeared to be in good condition and no indications of failure or leakage were noted.

- Exterior ASTs (3)
    - One, approximately 20,000-gallon propane AST next to the clarifier building, used to fuel forklifts.
    - One, approximately 500-gallon diesel fuel AST near the fuel oil USTs and the CNG station.

  - One, approximately 8,000-gallon AST formerly used to store vegetable oil, now unused, outside the east wall of the plant.
- Interior ASTs (15)
  - One, 5,000-gallon sulfuric acid AST in the bulk storage room.
  - Two, 3,000-gallon ASTs, two, 5,000-gallon ASTs, a 2,000-gallon AST and a 400 gallon AST used to store process reagents in the bulk storage room.
  - One, 8,000-gallon AST and one 5,600 gallon AST used to store process reagents in the stock preparation area.
  - One, 5,000-gallon AST and two, 3,000-gallon ASTs in the coating area used to store process reagents.
  - Two ASTs used to recycle slurry water in the filter stock area.
  - One, approximately 3,000-gallon AST in the sand filter house that is used to store sodium hypochlorite for disinfection.

There are many 2-300 gallon portable tote containers throughout the plant that are used to store process reagents, dyes, and treatment chemicals that are not considered ASTs due to their portability.

A standby power generator is located at the south end of the office building. According to plant personnel, this generator is used when the power goes out to keep essential plant functions operating. The generator has an integral diesel fuel tank, which showed no signs of leakage.

Drains, Sumps, and Ponded Water

Puddles of water were noted on the plant floor in proximity to the paper rolling operation, where the pulp was being dewatered. This is a normal part of the production process, and the water is conveyed through floor drains and downspouts to the basement sumps.

Water was present in a sump at the north end of the plant. Reportedly, this sump has had fuel oil in it before, and the side walls were stained black with apparent fuel oil. Six sorbent pads were deployed on the water surface, and had a reddish black stain indicative of possible fuel oil.

Floor drains were noted throughout the wet end paper production area. These drains convey water liberated from the pulp slurry during pressing and rolling, downward through downspouts to the basement sumps. From there, the sumps convey the discharge to the wastewater treatment plant. During the site reconnaissance, the water flowing through the drains and sumps appeared to be clear, with no indication of oily sheens or odors.

Drums and other Containers

Drums, totes and pails were identified throughout the plant, and outside of the plant. Containers inside the plant are in use for storage of oils and process reagents. Generally, the interior container storage practices were adequate, with no indication of adverse conditions. Drums were concentrated in the following areas:

- Satellite hazardous waste collection drums were noted at several locations. These were well labeled, although some were being used as tables.
- Approximately 20, 55-gallon drums labeled "Castrol" were in use and being stored in the finishing area. These drums contain lubricating oil for plant machinery. Approximately seven of these drums were in use and the in-use drums were on containment pallets. Little or no floor staining was noted.
- Approximately 4, 55-gallon drums labeled "Castrol" were present in an oil recovery area near the bulk chemical storage area. These drums appear to be used to contain oil recovered from machinery under repair. The oil recovery was taking place over a containment pallet.
- Two, 55-gallon drums were present inside a flammable materials storage cabinet. The drums were labeled "AEM 5772 Antimicrobial" Quaternary Ammonium Salt, with "Flammable" and "Toxic" labeling. The drums were grounded, presumably to reduce the risk of sparks. No secondary containment was noted.
- Approximately 50, 55-gallon drums and a similar number of 5-gallon pails were present in the raw materials storage area. These contained dyes and other process reagents.
- A single 55-gallon steel drum was noted on its side in the wooded area past the boneyard. The drum was labeled "Sartomer" (manufacturer of specialty acrylates and methacrylates monomers and oligomers) and appeared to be at least partially full. The drum was in poor condition, with corrosion and weathering noted.
- Approximately 20-30 55-gallon steel and plastic drums were being stored outside on pavement and on pallets at the north end of the paper plant. The labeling on the drums was widely variable, and it appeared that these were recycled drums from inside the plant. According to plant personnel, these drums contained spent sand from the sand filter house, awaiting disposal.

PCBs

Three PCB transformers are present at the facility. Two of these are in transformer houses on the roof of the paper plant and the third is inside a transformer house near the maintenance shop. All three transformers were inspected and no leaks were seen. Facility staff inspects the transformers regularly for indications of leaks, and the oil is tested for signs of explosive gas generation that could result in a release. Several other transformers at the facility have reportedly been tested and were found to not contain PCBs at regulated concentrations. There is an elevator

located in the office building portion of the plant that was installed in 1997 and consequently is too new to be at risk of containing PCBs. The age of the original building (1960s-70s) suggests that those portions could be at risk of having PCBs in paint and caulk.

Approximately one dozen electric overhead cranes are present in the production areas. These cranes are used to convey heavy objects across the plant. Some of the cranes in the older parts of the building may contain PCB oils due to their age. No obvious leaks or spills were observed from the plant floor.

In the "boneyard" portion of the property, numerous out of service electric motors, tanks, piping, valves, and other supplies are stored. Many of these objects appear to be quite old and could contain PCB oils. A yellow stain was noted in the boneyard adjacent to equipment that appeared to have hydraulic hoses attached. No other significant exterior staining was noted, however, the ground outside of plowed area was covered in snow, which obscured the ground surface.

Stressed vegetation was not observed, although snow obscured most of the ground surface. An area of stressed vegetation noted in the 2015 Phase I ESA was located but was also covered in snow so its present status could not be determined.

Solid Waste Disposal

There is an area at the north end of the cornfield that exhibits hummocky terrain, and exposed waste materials at the ground surface. This area corresponds to the 1989 survey map of the property that indicated "active fill area." Materials observed included concrete, rebar, asphalt, and plastic piping.

Wells

Two steel wellheads were observed in the landscaped grassy area across the road from the office building. According to plant personnel, these two wells are the backup sources of production water for the paper plant, which are used when the sand filter house or the river water system are being worked on. Several steel wellheads were observed in the cornfield area. These are believed to be associated with the WSWMD landfill on the adjoining property to the northwest.

LEE looked for, but did not find, evidence of the existing groundwater monitoring wells associated with the 1990 fuel oil release. There were reportedly 14 wells installed during that effort, but none of them were visible. There is no record of their abandonment, and it is possible that the wells were paved over and are still present.

7.0 INTERVIEWS

7.1. Interview with Property Owner and Site Manager

LEE interviewed Robert Murphy, Engineering Director and Punjan Tejani, Environmental Compliance Manager for Neenah Northeast, LLC. Mr. Murphy has been with Neenah for 10 years and Mr. Tejani has been with Neenah for 18 months. The following relevant information was shared during the interview.

- The property hosts an operating paper mill employing approximately 100 people. The mill accepts pulp and recycled paper from outside sources, and manufactures a 7-ply hard stock product suitable for report covers and similar applications. Typically, the inner plies are made of lesser quality fiber and the outer plies are better quality.
- The primary hazardous waste stream generated at the plant is oily rags. Universal wastes are generated, including fluorescent light bulbs and ballasts.
- Hazardous substances and petroleum products are used throughout the mill for process reagents, dyes, lubricants, fuels, disinfectants, and flocculants.[42]
- Bleaching is not performed at the plant. There are no known sources of PFAs used in the process.
- Potable water for the plant is provided by the town of Brattleboro water system. Process water (~1mm gallons per day) is pumped from the Connecticut River and is disinfected and filtered in the sand filter house prior to use. After heavy storms or in the wintertime, process water is sometimes drawn from two on-site production wells instead.
- Sewage disposal is provided by the town of Brattleboro. There is a small septic system with a leachfield at the north end of the plant, which serves a bathroom at the north end of the plant. Formerly, there was an on site leachfield that served most of the plant, it was located east of the employee parking lot.
- There is a lagoon wastewater treatment plant on the property for process water. There are four lagoon sections, three of which are aerated. The final treatment is done at the clarifier, where pH is adjusted and sludge is extracted for reuse as landfill daily cover at other sites. The lagoons are lined.
- A sump near the boiler room accepts condensate and occasionally oil is released to the sump, which is absorbed with sorbent pads.
- Drums are present throughout the facility, for lubricants, process reagents, and waste products.
- There are three PCB transformers on the property, which are closely monitored for leaks and accumulation of explosive gasses. No other PCBs are known.

[42] LEE requested access to safety data sheets on 11/28 (renewed request on 12/4).

- The plant is heated with a boiler that runs on compressed natural gas. Formerly it ran on #6 fuel oil. The fuel oil is now used as a backup source of heat. The conversion took place in 2014 and it resulted in a 70 ton per year reduction in particulate emissions.
- There are floor drains throughout the facility that accept water from the slurry dewatering process. This water is conveyed via downspouts to basement sumps, where it is piped to the on site wastewater treatment plant.
- Solid wastes generated at the plant include scrap metal and wire. Waste paper is recycled into the process. No disposal of solid waste or sludge on the property has occurred.
- There is a small septic system on the property that serves a bathroom at the north end of the plant. There used to be a septic system on the property next to the parking lot, but this was discontinued.

7.2. User Interview

Adam Grinold completed an ASTM document user questionnaire on behalf of BDCC on November 25, 2018. The document user checklist is in Appendix D. The following information was provided.

- BDCC is currently not aware of existing environmental liens on the property.
- BDCC is aware of use limitation appropriate to local zoning.
- BDCC is aware of the findings of previous Phase I ESAs.
- The purchase price reflects market valuation of the property.
- The Phase I ESA is being performed due to known issues from a previous report.

Michael Cammenga completed an ASTM document user questionnaire on behalf of Long Falls Paperboard on November 21, 2018. The document user checklist is in Appendix D. The following information was provided.

- Long Falls Paperboard is currently not aware of existing environmental liens on the property.
- Long Falls Paperboard is aware of use limitation appropriate to local zoning.
- Long Falls Paperboard is aware of the findings of previous Phase I ESAs.
- The purchase price reflects market valuation of the property.
- The Phase I ESA is being performed in support of BDCC's acquisition of the property and participation in the BRELLA program.

7.3. Interview with Local Government Officials

LEE interviewed Sue Fillion, Town of Brattleboro Director of Planning and Zoning on December 6, 2018. Ms. Fillion is aware of the property and its general environmental condition. She is aware that there was a site investigation many years ago, and that the property received a SMAC letter for that work. She is aware

of the potential for shallow soil contamination in an equipment storage area, and that there is some potential for groundwater contamination at the property, based on her discussions with state officials.

LEE received an electronic mail message from Brattleboro Town Fire Chief Michael Bucossi on November 26, 2018, indicating that the Town Fire Department records show no incidents of concern for hazardous materials or petroleum releases at the property.

7.4. Interview with Others

LEE spoke with Vermont DEC Solid Waste Program representative James Surwilo on November 29, 2018. Mr. Surwilo has been with the solid waste program for over 30 years and he does not recall being aware of or authorizing disposal of waste on the property during that time.

LEE received an electronic mail message from DEC Site Manager Richard Spiese on December 5, 2018. Mr. Spiese was the project manager for the Specialty Paperboard hazardous site investigation performed from 1990-1994, and has been employed by the DEC for over 30 years. Mr. Spiese was asked if he was aware of a 1996 waste oil release at the property and an unanswered DEC letter request for a workplan in 1998. He indicated he was aware of neither the 1996 waste oil release nor the 1998 letter requesting a work plan, and that the only event he was aware of was the fuel oil release that was granted SMAC status.

LEE contacted George Murray, former WSWMD Executive Director, via email on December 6, 2018. Mr. Murray was Executive Director of the WSWMD for approximately 15 years, ending in 2011. The following information was provided:

- Mr. Murray was generally aware of Fibermark's operations while he was at the WSWMD.
- He indicated that there were some spills in the area outside of the boiler room, but they were in a curbed area and were cleaned up quickly.
- He indicated that the plant disposed of substantial amounts of paper sludge in the WSWMD landfill during his tenure.
- He indicated that there might be some construction and demolition debris disposed of on the upstream side (north of) the lagoons, and that there used to be concrete and metal in that area.
- He confirmed that the groundwater beneath the landfill and its downgradient groundwater area of influence to the Connecticut River (including a portion of the property) has been reclassified to Class IV status under the Vermont Groundwater Rule.

8.0 FINDINGS

LEE has made the following findings during this Phase I ESA.

Historical Findings

1. The earliest historical resource used in this Phase I ESA (1893 USGS map) shows no development on the property. The only adjoining development is the railway line. The 1935 USGS map also shows no development on the property.
2. A 1951 air photo shows the property was cleared and undeveloped at that time, except for indications of excavation activity along the north end of the property. Adjoining properties appear to be in agricultural use. Excavation appears at the WSWMD landfill site. The railway line is present at this time. The Chickering family owned the property in 1951.
3. The 1954 USGS map shows the property undeveloped.
4. The 1958 property survey shows the property undeveloped except for an overhead electric line. A riverfront camp is shown on the adjoining property to the north.
5. The property was owned by the Allard family in 1958 and was transferred to BDCC on December 31, 1958.
6. The property ownership was transferred from BDCC to Case Brothers, Inc. in August 1960.
7. The first building (main plant) was constructed in 1960-61. A July 1961 newspaper article shows the newly constructed plant opening for operation.
8. Additions to the building were made in 1967, 1973, 1974, and 1978.
9. Case Brothers, Inc. merged with Boise-Cascade Corporation in 1968.
10. The 1972 and 1977 air photos show the property developed with the paper plant. The lagoons were not visible in these photos. Excavation appears to be taking place at the north end of the cornfield in these photos.
11. A 1980 septic system plan shows the on-site septic system east of the parking lot, in use at that time.
12. In 1982 the shipping area expansion and rail shed addition were built.
13. The 1984 USGS map and the 1985 air photo show the property developed with the paper plant and lagoons. The 1984 map also shows a separate structure located to the south of the paper plant in the approximate location of the current offices.
14. In 1988, the eastern warehouse addition was built.
15. The 1989 property survey shows the property built out similar to that seen in 2018. There is a notation at the north end of the property, “Active Fill Area”.
16. The plant continued to operate as Boise-Cascade through 1989, when the property was sold to Specialty Paperboard, Inc. Specialty Paperboard Inc. later became Fibermark.

17. The 1992 air photo shows the plant and lagoons. Construction appears to be taking place on the property to the west.
18. In 1996, the second story offices and the sand filter house were added and 1998 the hazardous material storage room was added.
19. Air photos from 1998-2012 show the property and adjoining properties developed as seen in 2018. Hummocky ground was visible at the north end of the cornfield in the 1998 photo.
20. During the 2018 site reconnaissance, evidence of on-property disposal of concrete, metal, asphalt, and plastic was observed at the north end of the cornfield.

Process Findings

1. The property hosts an operating paper mill employing approximately 100 people. The mill accepts pulp and recycled paper from outside sources, and manufactures 7-ply hard stock product used for report covers and similar applications. Typically, the inner plies are made of lesser quality fiber and the outer plies are better quality.
2. The process flow in the building is from north to south. Raw materials are received and stored in the north end, and finished product is shipped out the south end. In between are machinery, infrastructure, supplies and equipment for wet end operations (slurry mixing, spreading, dewatering, rolling) and dry end operations (binding, finishing, embossing/glazing, packaging and warehousing). Pulping is not performed at the property. Bleaching is not currently performed on the property, although there is some indication that bleaching was formerly performed in the 1960s and the 1970s.[43]
3. Pulp created elsewhere, along with recycled paper stock, is mixed with water to create slurry in several vats near the south end of the plant. The slurry is conveyed to a papermaking machine that dewaters the slurry. The process incorporates higher quality fiber on the finish surfaces and lesser quality fiber for the internal layers. The individual layers are rolled together to create the final product, which then is cut, finished, embossed/glazed and packaged for shipment.
4. The process consumes substantial quantities of water (greater than 1 mm gallons per day), which is mixed with pulp and recycled paper to form slurry. Most of this water is pumped from the Connecticut River and is treated in the sand filter house prior to use. Two wells on the property serve as a backup supply of process water, and the facility is also connected to the Brattleboro town water system.
5. Much of the water is liberated during the dewatering / rolling process as liquid water and steam. The liquid water is released onto the floor of the plant, where it is conveyed via floor drains and downspouts to the basement and into the floor sumps, which drain to the on-site wastewater treatment

[43] Ramboll Environ, 2015.

facility. There is indication that on occasion, oils and other wastes have been conveyed to the floor sumps.

6. The wastewater treatment plant includes four aerated treatment lagoons and a clarifier. Influent is conveyed to the wastewater treatment plant via pipe and the effluent is discharged to the Connecticut River.
7. The paper making process uses substantial amounts of process reagents, some of which are hazardous substances or petroleum products. These substances are stored on site in tanks, drums, totes and other containers. Generally, the storage practices appear to be adequate. Hazardous substances are also used in disinfecting the process water and for wastewater treatment. Chlorinated solvents are not used at the plant, although they were used historically. PFCs are not used as a process reagent at the plant.
8. Historically the plant was heated with #6 fuel oil until 2014, when compressed natural gas began to be used, resulting in a substantial reduction in airborne particulate emissions.

Regulatory and Environmental Findings

1. The property is DEC Site #90-0482 due to a #6 fuel oil release discovered during UST removals in 1990. Residual fuel oil, which appeared to be solidified and immobile, was left in the ground. A Site investigation was performed, and the property received a SMAC letter, and no further investigation of the fuel oil release is being required by the DEC at this time.
2. Groundwater beneath the northern portion of the property (north of the lagoons) was reclassified to Class IV (non-potable) due to influence from the adjoining WSWMD landfill.
3. CVOCs were detected in the groundwater near the plant during the 1990 and the 1994 groundwater monitoring events. The cVOC concentrations diminished from 1990 to 1994 and by 1994, none of the cVOC concentrations exceeded groundwater standards. The cVOCs were also present in the groundwater west of the plant in 1994. The cVOC profile reported in these wells consisted of trichlorofluoromethane (a refrigerant), PCE and 1,1,1-TCA (solvents).
4. The property is on the Vermont UST registry and has two active 25,000-gallon #6 fuel oil USTs. The fuel oil is a backup source of heat for the plant. Five USTs were also documented as being removed in 1988 and 1990.
5. The property is a RCRA LQG of hazardous waste (mostly oily rags and oil/water), a TRIS inventory location, a hazardous waste manifest generator site, a reported spills site, a registered AST site, a PCB Transformer registry site and a Vermont Tier 2 inventory site. The property was on the EPA CWA watch list in 2013.
6. At least 17 groundwater monitoring wells were installed during the early 1990's investigation into the #6 fuel oil release. These are in addition to several groundwater monitoring wells installed on the property to monitor the WSWMD landfill. The only groundwater monitoring wells that LEE

observed during the 2018 site reconnaissance were four wells related to the WSWMD landfill, and no wells related to the early 1990s site investigation were observed. There is no record of these wells having been abandoned and it is likely that they have been paved over. It is possible that the wells still exist beneath the pavement.

Adjoining Property Findings

1. The adjoining property to the east is the Connecticut River.
2. A railway line has run to the west of the property since at least 1893.
3. The adjoining property to the north appears to have been wooded land, with a riverfront camp noted historically.
4. The adjoining property to the northwest is the closed WSWMD landfill. The landfill was operational from the 1950s until the early 1990s. Groundwater beneath the landfill and its downgradient area of influence to the Connecticut River was reclassified to Class IV groundwater under the Vermont Groundwater Rule. The WSWMD landfill has several monitoring wells on the property. The data from these wells indicates that the landfill has impacted the groundwater quality beneath the northern end of the property with elevated concentrations of arsenic, iron, manganese, and COD. Petroleum VOCs and cVOCs have been detected in the groundwater from these wells. PFCs were tested for in two of the WSWMD landfill monitoring wells and were detected at concentrations below state groundwater standards. Neither of the landfill's monitoring wells sampled for PFCs was on the property. The WSWMD landfill is also a RCRA generator of hazardous waste, due to ongoing household hazardous waste collection activities.
5. The adjoining property to the west is the C&S Wholesale Grocers facility. This property was undeveloped until circa 1980. Expansion of the facility took place in the early 1990s. C&S Wholesale Grocers is an active hazardous site (DEC Site #92-1258) and an inactive hazardous Site (DEC Site #2009-3895), both due to historical petroleum releases from USTs. The active site is open pending documentation of disposal of treated contaminated soils. The inactive site has a notice to land records for residual diesel fuel contamination in the soil. The facility is also a RCRA hazardous waste generator, UST registry site, and a reported spill site.
6. The adjoining property to the southwest is the BDCC Business Park and the former Book Press site. The Book Press was built after 1954 and later became the BDCC multi-tenant business park. This site is an inactive hazardous site (DEC Site #93-1461) due to petroleum releases discovered during UST removals in 1992. Follow up investigations determined that little or no soil contamination was present and the site was granted SMAC status.
7. The adjoining property to the south (Suburban Propane) is a Tier 2 and AST registry site.

9.0 OPINION

LEE has identified the following 12 RECs as defined by ASTM.

1. #6 fuel oil release (historical REC and REC).

    a. The documented #6 fuel oil release is a REC due to the likelihood that the released fuel oil is still present in soil and groundwater due to its very low mobility and recalcitrance to degradation. It is an historical REC because the DEC has issued a SMAC letter and is not asking for further investigations.

2. Diesel and gasoline USTs removed in 1988.

    a. One diesel UST and two gasoline USTs were removed in 1988. A DEC inspector was present for the removals, but there is no field screening data or laboratory data to document the environmental conditions during the removals. The conditions of two of the three USTs were "rusted", and the 1990 site investigation report attributes petroleum VOC contamination found in groundwater to a gasoline UST that was removed previously. The locations of these USTs were described in the 1986 UST notification to be "north of the Krofts building", and south of the #6 fuel oil USTs. It is possible that the former UST locations were built over during the 1988 eastern warehouse expansion. This situation is a REC due to the possibility that residual petroleum contamination is present at and below the former UST locations.

3. Use of the property for paper manufacturing for 58 years may have resulted in soil, groundwater and/or soil vapor contamination.

    a. Potential contaminants of concern include VOCs including chlorinated solvents, metals, dioxin, and PFCs. Chlorinated solvents have been found in groundwater near the plant. Copper is currently used in pigments in the paper making process, and historically, other metals may have been used as well. Bleaching was performed in the 1960s and the 1970s and dioxin may be present in soil near the plant due to emissions. PFCs, while not used as a process reagent, may have been present in imported raw materials.
    b. Bleaching of pulp is not performed at the plant according to the owner representatives. However, previous Phase I ESA reports document that some bleaching was performed in the 1960s and into the 1970s before the process was discontinued. According to USEPA, *"In bleaching, the processed and refined pulp is chemically altered to increase brightness. It is in the bleaching process that the most*

problematic contaminant for pulp and paper mills is produced: dioxins. Dioxins (and also furans) are a class of chemicals of the highest toxicity to all life. They are extremely persistent and cannot be broken down by bacteria. …. Waste is produced when water is used to flush the chlorine and other substances from the paper. It is estimated that over 28,000 gallons of water are used (mostly in bleaching) to produce one ton of paper. When this water is released, … many contaminants are released into the environment."[44] It is possible that dioxins were produced at the property during historic bleaching and were released to the environment through steam emissions and aqueous emissions. This situation is a REC due to the recalcitrance of dioxins to degrade over time and the possibility that they are present in soils at the facility.

4. Releases to basement floor sumps and underground piping of unknown integrity.

    a. According to previous Phase I ESAs, *"The basement sumps in the main building receive dyes, adhesives, cleaners, oils, paper slurry, and process water from floor drains in the production areas. Pools of standing liquid are present throughout the basement. Because of the lack of integrity testing and regular inspections of the floor drains and sumps, cracks in the sump may allow contaminants to reach the subsurface. According to Company personnel, FiberMark does not routinely conduct integrity inspections on the sumps and associated floor drains, and there has been no regulatory scrutiny related to basement sumps."*
    b. According to USEPA, *"papermaking contaminants may include waste sludge, bleaching and pulping contaminants, VOCs and SVOCs in coatings, biocides, chlorinated phenols, amino and quaternary ammonium compounds, organosulfur compounds, silver and titanium residue, oil and grease, dyes, PCBs and pesticides. Media of concern may include soils, with the major contaminant of concern being dioxin. Surface and groundwater can also be contaminated with paper mill wastes. Surface water contamination tends to be short-term, especially if the water body is a river."* [45]
    c. This situation is a REC due to the potential for leakage from the sumps and/or the piping conveying the plant effluent to the wastewater treatment plant, and the ensuing soil and groundwater contamination that may have occurred.

5. Equipment Storage Yard

    a. The equipment storage yard contains a variety of used and spent plant equipment, some of which contains oils. LEE observed fresh

[44] EPA, 2002, pg. 6.
[45] USEPA, 2000.

spillage of apparent yellow hydraulic oil onto the snow during the Site reconnaissance. Given the duration of use of this area for equipment storage and the variety of equipment that has been stored there, the potential for oils, solvents, metals and PCBs to be present in the shallow soils there is a REC.

6. Abandoned Drum

    a. During the site reconnaissance, LEE noted one abandoned drum in the woods past the boneyard. The drum was in poor condition and appeared to contain "Sartomer" specialty acrylates and methacrylates monomers and oligomers. This situation is a REC due to the potential for release(s) to the soils from this drum and possibly others that could have existed in the vicinity.

7. Fill at the north end of the property

    a. Evidence of filling at the north end of the property was discovered during this Phase I ESA. During the Site reconnaissance, concrete, asphalt, metal and plastic were observed on the ground surface, which was hummocky and uneven. One of the knowledgeable persons interviewed during this Phase I ESA stated that construction and demolition debris might be buried at the north end of the property. The 1989 property survey designates an "active fill area" in this location, and the air photos from 1951, 1972, and 1977 appear to show excavation in this area. The 1998 air photo shows hummocky ground in this area. This situation is a REC due to the potential for uncontrolled disposal of non-inert debris, paper sludge, or solid and hazardous waste, and resulting contamination to soil and/or groundwater. The groundwater beneath this area is Class IV (non-potable) according to the Vermont Groundwater Rule.

8. WSWMD landfill documented influence on the property's groundwater quality

    a. The groundwater monitoring results for the WSWMD landfill verify that landfill contamination has adversely impacted the groundwater quality at the north end of the property. Contamination by arsenic, iron, manganese and VOCs at concentrations above state groundwater standards has been documented. Elevated levels of chloride and sodium have also been documented, however these appear to be below state standards. This situation is a REC due to the presence of landfill related groundwater contamination. Since the groundwater beneath the property has been reclassified to Class IV (non-potable) according to the Vermont Groundwater Rule, this situation is a Controlled REC.

b. PFCs have been documented in groundwater downgradient of the closed WSWMD landfill, but the sampled groundwater monitoring wells were not on the property. The PFCs were below current state standards. It is possible that PFCs are present in groundwater beneath the property downgradient of the closed landfill.

9. Active Septic system north of the mill

a. The active septic system serving the north end receiving bathroom and lab sink may have received industrial waste disposal. The 1989 survey plan shows the leachfield location to be west of the wastewater treatment plant lagoons. The 2015 Phase I ESA documented stressed vegetation in the same location and plant personnel could not determine the cause of the stressed vegetation at the time. It is possible that surfacing effluent from the septic system caused the stressed vegetation and if that effluent contained hazardous substances or petroleum products, its effects could be exacerbated. This situation is a REC.

10. Unused Septic System east of the mill

a. The septic system east of the parking lot operated from 1961 until 2002, at which time the facility was connected to the Brattleboro town wastewater system according to the 2015 Phase I ESA. It is possible that industrial discharges to the septic system took place through sinks or drains during its 40+ year period of operation. No documentation was found that the septic system was removed or tested. This situation is a REC.

11. Adjacent Railway Line

a. The adjacent railway line has been in operation for over 125 years. Main railway lines are often treated with herbicides, which can contaminate the soil on adjoining properties if not applied precisely. Older railway lines also used coal-fired engines that emitted polycyclic aromatic hydrocarbons (PAHs), which also have potential to result in contamination on adjoining properties. This situation is a REC.

12. Historic Adjoining Printing Press (Book Press)

a. Potential releases of hazardous substances and/or petroleum products from the historical printing press adjoining the property to the west are a REC. The Book Press was a printing press for many years, beginning in the 1950's according to the Brattleboro Historical Society. Printing presses of that era commonly used VOCs and metals

in their printing processes. There is potential for a release to the environment from the former printing press. The Site appears to be hydraulically upgradient of the property with respect to groundwater flow. A Site investigation was performed at the former Book Press Site, but it focused on petroleum contamination in the soil to 10' depth due to a suspected release from petroleum USTs. LEE did not find data to confirm that groundwater beneath the former Book Press property was tested for VOCs or metals.

Several other aspects of the facility of environmental concern were examined and were determined to not be RECs in LEE's opinion. These are summarized as follows.

1. Wastewater Lagoons: The lagoons receive process water for treatment from the clarifier building. It appears that the process water discharge has from time to time also included oily substances, dyes, adhesives, cleaners and paper slurry, according to the 2015 Phase I ESA. These substances would first be conveyed to the clarifier building, where observation and recovery would be possible. Once mixed and diluted into the overall process waste stream, the concentrations of these substances would become substantially lowered to the point where detection in environmental media at levels of concern would become unlikely. The wastewater lagoons are lined, limiting the amount of wastewater that could discharge onto the property. Therefore, the wastewater lagoons are not considered to be a REC because designation requires a finding of "presence or likely presence."
2. Other off-site sources of potential contamination including the UPS and C&S Grocers are not considered to be RECs. The contamination at those Sites has been reasonably documented and the migration potential onto the property appears to be limited and to not meet the "presence or likely presence" criteria in ASTM.
3. PCB Transformers and Other Possible media: PCBs have been documented in three on-property electrical transformers. These transformers are closely monitored for leaks and evidence of explosive gas accumulation, and at present do not present a significant threat of subsurface contamination. It is possible that the older overhead cranes in the building also contain PCBs. They have not been tested to the best of LEE's knowledge. An oil leak from an overhead crane would likely be noticed relatively quickly and in time for a rapid cleanup on the plant floor. It seems unlikely that a significant leak would find its way to the basement sumps or the wastewater system. The potential presence of PCBs in building paint and caulk is not a REC due to its limited potential to cause subsurface contamination. PCB containing transformers and other devices within the plant are considered by LEE to be business environmental risks per ASTM due to the potential costs of compliance and monitoring.
4. Various property spills: the Phase I ESAs conducted on the property have documented several petroleum spills, all of which were cleaned up. Most of the spills were contained in the plant, on pavement or in the wastewater

treatment system, except for a 1992 fuel oil spill (4,000 gallons) and a 1995 wastewater overflow. The 1992 spill involved spillage of oil in the containment area, parking lot, storm drains and approximately 58 gallons discharged to the Connecticut River. It does not appear that a significant amount of fuel oil was released to the soil from these spills, or that significant subsurface contamination would be likely to have resulted from these spills. These spills are considered to be de minimis conditions.

5. Several of the past Phase I ESAs reference a 1996 waste oil release and a 1998 DEC letter requesting that a site investigation be performed in response to the release. The source of the information was reportedly an environmental database report prepared by EDR, contained in the 1999 Phase I ESA report by Clayton. This EDR report was not available for LEE's review during this Phase I ESA. DEC Site Manager Richard Spiese was unaware of any such release or outstanding request. LEE reviewed the DEC's reported spills database and there were no spills reported at the facility in 1996. It does not seem that the 1996 waste oil spill took place at this property. It is possible that the spill location and the subsequent DEC request letter pertained to a different property and that the EDR report mis-identified the location in its 1999 database report. This situation is not a REC or a de minimis condition.

9.1 Additional Investigation

No additional investigations are deemed necessary to ascertain the presence or absence of RECs. Per ASTM E 1527-13, this opinion regarding additional investigations is only intended to convey those additional investigations that may be necessary to ascertain the presence or absence of a REC. It does not convey any recommendation relative to the need to perform a Phase II ESA or other assessment activities at the property.

10.0 CONCLUSIONS

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527 of the Neenah Paper Facility, 161 Wellington Road, Brattleboro, Vermont, the property. Any exceptions to, or deletions from, this practice are described in Section 11.0 of this report. This assessment has revealed no evidence of recognized environmental conditions in connection with the property except for the following.

1. Documented #6 fuel oil release (historical REC and REC) due to leaking USTs.
2. Potential petroleum contamination due to diesel and gasoline USTs removed in 1988.
3. Use of the property for paper manufacturing for 58 years, which may have resulted in soil, groundwater and/or soil vapor contamination. Potential contaminants of concern include VOCs, semivolatile organic compounds, metals, dioxin, and PFCs.
4. Potential chemical and petroleum discharge to basement floor sumps and underground piping of unknown integrity possibly resulting in releases via piping breaches.
5. Visible and potential releases from equipment in the storage yard.
6. Potential for subsurface contamination due to an abandoned drum.
7. Filled area at the north end of the property with undocumented fill materials.
8. WSWMD landfill documented and potential influence on the property's groundwater quality (Controlled REC).
9. Potential soil and groundwater contamination from the active septic system north of the mill.
10. Potential soil and groundwater contamination from the unused septic system east of the mill.
11. Potential contamination in connection with the active rail line adjoining the west side of the facility.
12. Potential releases of hazardous substances and/or petroleum products from the historical printing press adjoining the property to the west.

A recognized environmental condition is defined in ASTM E 1527 as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property:

1) due to release to the environment;
2) under conditions indicative of a release to the environment; or
3) under conditions that pose a material threat of a future release to the environment.

De minimis conditions are not recognized environmental conditions.

10.1 Recommendations

A Phase II ESA is recommended to determine whether the identified RECs have resulted in subsurface contamination. The following specific recommendations are made:

1. The Phase II ESA should include soil, groundwater and soil gas testing. CVOC detections in groundwater at 70-foot depth suggest there is a source of cVOCs in the nearby soils.
2. Groundwater monitoring wells from the previous site investigation may be present beneath the pavement. These wells were 70-80 feet deep and in light of the cost of replacement, a geophysical survey to attempt to locate the buried wells might be cost effective.
3. Groundwater beneath the northern portion of the property in the Class IV zone is non-potable and its investigation may be less of a priority than elsewhere on the property. The contents of the fill area should be evaluated via backhoe test pits to determine if hazardous substances and/or petroleum products are present and whether there is soil contamination.
4. A video evaluation of the basement sump and piping system could provide useful information on the condition of the piping and whether there are breaches that should be evaluated for soil contamination.

11.0 DEVIATIONS

11.1. Deviations/Data Gaps

Noted deviations to the ASTM Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM E 1527-13) included: none.

Data gaps were identified as follows:

1. During the site reconnaissance and afterward, LEE requested to review the facility's safety data sheets. LEE renewed this request during preparation of this report, however, as of the date of this report, no response has been received. LEE does not believe that this data gap has affected its ability to identify a REC because LEE had access to extensive Tier 2 reporting information, and because the use and storage of hazardous substances and petroleum products has been identified as a REC (see Section 10, #3, #4, #5).
2. LEE did not fully document the property's history in maximum 5-year intervals as stated in ASTM E1527-13, Section 8.3.2.1. Greater than 5-year intervals were noted from 1893 to 1935, from 1935 to 1951, and from 1961 to 1972. LEE does not believe that this data gap has affected its ability to

identify a REC, due to the relative continuity of use before and after the property's development as a paper mill.

Snow partially covered the ground during LEE's site reconnaissance, and is considered to be a limiting condition.

11.2. Significant Assumptions

LEE undertook performance of this Phase I ESA according to the following assumptions: None.

11.3. Limitations and Exclusions

LEE has prepared this Phase I ESA report in accord with ASTM E 1527-13 using the best efforts of Environmental Professionals and information available at the time of preparation. This report is intended to convey a point-in-time environmental evaluation of the property, as well as relevant information on past uses. The user of this document must recognize the limitations inherent in conducting a Phase I ESA, as stated in ASTM E 1527-13, which include but are not necessarily limited to:

- This document does not address regulatory compliance issues and LEE makes no assurances relative to the federal, state or local regulatory compliance of the property (ref. Section 1.4).
- Uncertainty Not Eliminated: No environmental site assessment can wholly eliminate uncertainty regarding the potential for recognized environmental conditions in connection with a property. Performance of this practice is intended to reduce, but not eliminate, uncertainty regarding the potential for recognized environmental conditions in connection with a property, and this practice recognizes reasonable limits of time and cost (ref. Section 4.5.1).
- All appropriate inquiry as defined by ASTM E 1527-13 is not an exhaustive assessment of a property (ref. Section 4.5.2).
- A variable level of inquiry may be conducted depending on the specific characteristics and features of the property and the information developed during the course of the assessment (ref. Section 4.5.3).
- An assessment meeting or exceeding the requirements of ASTM E 1527-13 and completed less than 180 days prior to the date of acquisition or intended transaction is presumed to be valid (ref. Section 4.6).
- All appropriate inquiry as defined by ASTM E 1527-13 is not exhaustive and does not require assessment of historic uses more frequently than every five years (ref. Section 8.3.2.1).

11.4. Special Contractual Conditions

None.

11.5. User Reliance

This report is for the use and benefit of client as defined herein. Affiliates of client, and third parties authorized in writing by LEE and client, may rely upon this report to the extent that client is entitled to do so, provided said parties agree to abide by the limitations and exclusions as stated herein.

12.0 ADDITIONAL SERVICES

No additional services as defined in ASTM E1527-13 were requested or provided.

NOTES:

1. METHOD OF SURVEY: THEODOLITE AND ELECTRONIC DISTANCE METER. BEARINGS ARE ORIENTED TO MERIDIAN OF BOSTON & MAINE RAILROAD PER MAP REFERENCE #2.
2. PROPERTY EXTENDS TO THE VERMONT - NEW HAMPSHIRE STATE LINE WHICH WAS DECREED BY THE UNITED STATES SUPREME COURT IN 1933 TO BE THE LOW-WATER MARK ON THE WEST SIDE OF THE CONNECTICUT RIVER. THE LOCATION SHOWN WAS PLOTTED FROM MEASUREMENTS MADE ON MAY 4, 1989 AND MAY OR MAY NOT REPRESENT THE ACTUAL LOCATION OF THE LIMIT OF TITLE.
3. THE LOCATION OF THE RAILROAD BOUNDARIES WAS DETERMINED BY HOLDING THE RECORD LAYOUT PER MAP REFERENCE #2 THROUGH BOUNDS FOUND AT POINTS "A" & "B". THE CURVED PORTION ON THE NORTHERLY END WAS DETERMINED BY OBTAINING THE BEST FIT WITH THE ACTUAL LOCATION OF THE TRACKS
4. PORTIONS OF THE SUBJECT PROPERTY ABUTTING THE CONNECTICUT RIVER LIE WITHIN FLOOD ZONE DESIGNATIONS ZONE A13 AND ZONE B AS SHOWN ON "FLOOD INSURANCE RATE MAP, TOWN OF BRATTLEBORO, VERMONT, WINDHAM COUNTY, COMMUNITY-PANEL NUMBER 500126 0015 B, EFFECTIVE DECEMBER 4, 1985.
5. UNDERGROUND FACILITIES, STRUCTURES AND UTILITIES HAVE BEEN PLOTTED FROM DATA OBTAINED BY FIELD SURVEY AND PREVIOUS MAPS AND RECORDS, THEREFORE THEIR LOCATIONS MUST BE CONSIDERED APPROXIMATE ONLY. THERE MAY BE ADDITIONAL UNDERGROUND UTILITIES NOT SHOWN ON THIS SURVEY, NOT FOUND BY THIS SURVEY.
6. AN UNDETERMINED PORTION OF THE NORTH END OF THIS PROPERTY IS SUBJECT TO CONDITIONS PER BOOK 43, PAGE 71.
7. THE BEARING AND DISTANCE BETWEEN POINTS "C" AND "D", WHICH ARE THE INTERSECTIONS OF THE RESPECTIVE PROPERTY LINES WITH THE LINE OF THE CONNECTICUT RIVER PER NOTE #2 ABOVE, IS S 56°31'46" W, 3274.95', AND IS GIVEN FOR CLOSURE PURPOSES ONLY.
8. THE BEARINGS AND DISTANCES OF THE FLOWAGE EASEMENT PER BOOK 60, PAGE 534 HAVE BEEN ADJUSTED TO PRODUCE A CLOSED FIGURE AND ORIENTED TO CONFORM WITH THIS SURVEY.
9. PROPERTY IS SUBJECT TO THE TERMS AND CONDITIONS OF STATE OF VERMONT LAND USE PERMIT NO. 2W0536 AND RECORDED IN BOOK 168, PAGES 391-394.
10. PROPERTY IS SUBJECT TO THE TERMS AND CONDITIONS OF VERMONT NOTIFICATION FOR UNDERGROUND STORAGE TANKS RECORDED IN BOOK 189, PAGE 384 AND NOTICE OF PARTIAL REMOVAL OF UNDERGROUND STORAGE TANKS RECORDED IN BOOK 207, PAGE 229.
11. PROPERTY IS SUBJECT TO SUCH RIGHTS THE PUBLIC MAY HAVE, INCLUDING RIPARIAN RIGHTS, IN AND TO THE USE OF THE WATERS OF THE CONNECTICUT RIVER.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by ENVIRON International Corporation were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

APPENDIX C

SITE RECONNAISSANCE CHECKLIST

Date: November 28, 2018

Site Name: Neenah Northeast LLC

Location: 161 Wellington Road, Brattleboro, Vermont

With: Robert Murphy, Engineering Director
Punjan Tejani, Environmental Compliance Manager

Affiliation: Property owner representatives

Contact Info: (802) 257-5949

Section 1. General Site Setting (ASTM E-1527-13 Section 9.4.1)

A. Current uses of the property (Section 9.4.1.1): Describe current property uses with emphasis on those likely to involve use, treatment, storage, disposal and/or generation of hazardous substances and/or petroleum products. Generate site sketch map (or obtain existing site plans). Include an estimate of the subject property boundaries. Include detail sketches if appropriate. Describe structures and other improvements on the property.

The property consists of approximately 40 acres of land along the Connecticut River. It hosts an approximately 200,000 square foot fully operational paper manufacturing plant employing approximately 100 people. The plant obtains pulp and recycled paper from outside sources and produces a 7-ply hard stock finished product. The property also includes a wastewater treatment plant for process water, a water filtration plant for process water, and an agricultural field that has been leased to area farmers in the past.

B. Past uses of the property (Section 9.4.1.2): To the extent visually evident, describe past property uses with emphasis on those likely to involve use, treatment, storage, disposal and/or generation of hazardous substances and/or petroleum products.

According to historical sources the property initiated papermaking in 1960. Prior to 1960, the property was undeveloped except for possible agricultural purposes.

C. Current and past uses of adjoining properties (Section 9.4.1.3 and 9.4.1.4.): To the extent visually identifiable from the subject property, list current uses of adjoining properties with emphasis on those likely to indicate recognized environmental conditions on the subject property. If past uses of adjoining properties with such potential are evident list these also.

Current uses of the adjoining properties were observed as follows:

- North: undeveloped woodland.
- East: Connecticut River.
- South: Green Mountain Power substation, Wellington Road.
- West: (south to north): Suburban Propane; BDCC Business Park (multi-tenant, former Book Press), C&S Wholesale Grocers, Closed WSWMD Landfill.

Past uses of the adjoining properties were not visually evident during the site reconnaissance.

D. Current or past uses in the surrounding area (Section 9.4.1.5): To the extent visually identifiable from the subject property and public thoroughfares in the vicinity, describe general area development with potential to indicate recognized environmental conditions with the subject property.

The property is at the eastern edge of the Brattleboro Industrial Zone, which encompasses most of the area east of Putney Road and north of I-91 Exit 3. Development in this zone includes industrial manufacturing, warehouses, retail and wholesale distribution. The property's location between much of this development and the Connecticut River suggests that the property may be hydraulically downgradient from much of it.

E. Geologic, Hydrogeologic, Hydrologic and Topographic Conditions (Section 9.4.1.6): Describe the overall property setting. Describe natural bodies of water (including springs and seeps) and possible wetlands on subject property and indicate location(s) on site sketch map. Note presence of exposed bedrock on property grounds and indicate general location(s) on site sketch map.

The property is situated on a flat alluvial terrace overlooking the Connecticut River and approximately 70 feet higher than the river. The soils beneath the property consist predominantly of sand and gravel according to soil boring logs from the 1990 subsurface investigation. No natural bodies of water were observed on the property. No exposed bedrock was noted, although snow partially obscured the ground surface during the site reconnaissance.

F. General Description of Structures (Section 9.4.1.7): Describe structures or other improvements on the property including number and size of buildings, footprints, number of stories each, approximate age of buildings, occupancy status, pavement, fences, foundations/ruins, utilities, product pipelines, and ancillary structures such as railroad spurs and power transmission lines.

Three structures designed for occupancy were identified on the property. These include the paper plant, the wastewater treatment plant, and the sand filter house.

Paper Plant

The main paper plant is an approximately 200,000 square foot concrete and metal building structure with a partial basement and partial second floor. The first building (main plant) was constructed in 1960, with additions to the building in 1967, 1973, 1974, 1978, 1982 (shipping area expansion and rail shed addition), 1988 (eastern warehouse addition), 1996 (second story offices and sand filter house), and 1998 (hazardous material storage room).

The building houses equipment and supplies for processing pulp and recycled paper into 7-ply card stock. The process flow in the building is from north to south. Raw materials are received and stored in the north end, and finished product is shipped out the south end. In between are machinery, infrastructure, supplies and equipment for wet end operations (slurry mixing, spreading, dewatering, rolling) and dry end operations (binding, finishing, embossing/glazing, packaging and warehousing). Pulping is not performed at the property. Bleaching is not currently performed on the property, although there is some indication that bleaching was formerly performed in the 1960s and the 1970s.

Pulp created elsewhere, along with recycled paper stock, is mixed with water to create slurry in several vats near the south end of the plant. The slurry is conveyed to a papermaking machine that dewaters the slurry. The process incorporates higher quality fiber on the finish surfaces and lesser quality fiber for the internal layers. The individual layers are rolled together to create the rolled final product, which then is cut, finished, embossed/glazed and packaged for shipment.

The process as described consumes substantial quantities of water (greater than 1 mm gallons per day), which is mixed with pulp and recycled paper to form slurry. Much of the water is liberated during the dewatering / rolling process as liquid water and steam. The liquid water is released onto the floor of the plant, where it is conveyed via floor drains and downspouts to the basement and into the floor sumps, which drain to the on-site wastewater treatment facility.

The building includes the production facility, along with a maintenance shop, parts warehouse, boiler room, raw materials storage area, finished product warehouse, an office building and laboratory, and a shipping area and loading docks. There are roof top electrical transformers as well as electrical transformers within the building and an electrical substation on the east side of the building.

Outside of the building and proximal are several facilities including a compressed natural gas facility that provides fuel for building and process heat, a hazardous materials storage area, a fuel oil UST area that also includes a diesel AST, a covered rail spur with several railroad box cars that are currently used for dry parts storage, and an electrical substation.

Wastewater Treatment Plant

The wastewater treatment plant includes four aerated treatment lagoons built in 1972 and a clarifier that was built in 1960. The lagoons are approximately 160 feet wide each and are oriented parallel to the Connecticut River. Influent is conveyed to the wastewater treatment plant via pipe and the effluent is discharged to the Connecticut River. The clarifier is a large (75' diameter) cylindrical tank adjacent to a cinder block building that houses a sludge conveyor and wastewater effluent treatment monitoring equipment and chemicals. The clarifier building is approximately 30' wide and 45' long and is two stories tall. Approximately 30 cubic yards of wastewater sludge were stockpiled next to the clarifier at the time of the site reconnaissance.

Sand Filter House

The sand filter house is a single-story cement block building approximately 20' wide and 40' long. It was built in 1996 to treat process water from the river. It houses a disinfection unit (sodium hypochlorite) stored in a vertical AST, and six large steel tanks containing sand for filtration. The sand filter house is located directly across the access road from the clarifier building. Sand is periodically removed from the filters and is drummed for disposal. Drummed sand is stored outside the north end of the paper mill building.

Three smaller structures were also identified but were not inspected due to confined space issues: the subsurface vault associated with the process water supply system; the subsurface vault associated with the main connection to the Brattleboro wastewater system; and, the water intake structure at the river's edge. None of these is anticipated to contain petroleum products or hazardous substances.

G. Roads (Section 9.4.1.8): List public thoroughfares, roads, streets and parking facilities adjoining / on the subject property.

The property is accessed from Wellington Road from the south. There is a parking lot on the property and an access road to the wastewater plant and the cornfield along the east side of the property.

H. Potable Water Supply (Section 9.4.1.9): Identify potable water supply source(s) for the subject property as apparent from visual inspection.

Potable water for the mill is supplied by the town of Brattleboro municipal system.

I. Sewage Disposal System (Section 9.4.1.10): Identify current sewage disposal system as apparent from visual inspection.

Sewage disposal for the mill is provided by the town of Brattleboro municipal system, except for a bathroom and lab sinks at the north end of the paper mill building, which are serviced by a septic tank and pump station at the north end of the paper mill building, and a leachfield at the west side of the treatment lagoons.

Section 2. Interior and Exterior Observations (ASTM E-1527-13 Section 9.4.2)

A. Current and Past Property Use (Sections 9.4.2.1 and 9.4.2.2): If building structures are identified on the subject property, visually inspect accessible common areas (lobbies, hallways), maintenance and repair areas (boiler rooms) and a representative sample of occupant spaces. Identify below which interior spaces were inspected and describe. Also note which interior spaces were not inspected.

LEE inspected virtually the entire property, including the interior of the paper mill building, the clarifier building and the sand filter house, except for some office space, and outdoor structures not designed for occupancy (water pump house, water intake house, septic manhole) due to confined space entry issues.

B. Hazardous Substances and Petroleum Products and Unidentified Containers (Sections 9.4.2.3, 9.4.2.8 and 9.4.2.9): List apparent hazardous substances, petroleum products, pollutants, contaminants, unidentified containers and raw materials observed interior to any buildings. Include type, container size and quantity, locations and whether stored appropriately. Note presence or absence of labeling, content according to labels, drum condition. Are adverse environmental conditions observed? Obtain/ review Material Safety Data Sheets if possible.

Hazardous substances and petroleum products were noted throughout the paper mill building. Generally the storage of these substances was well-organized, with no spills or obvious releases noted. A summary of the hazardous substances and petroleum products noted inside the mill is as follows. The approximate maximum volumes of substances are based on tank volumes and Tier 2 information.

- Organic reagents (diethanolamine (300 gallons), cyclohexylamine (300 gallons), 1-methyl-2-pyrrodone (200 gallons), potassium dodecylbenzene suphonate (1,000 gallons), dipropylene (4,000 gallons), ethyl acrylate, 2-propanol, 2,2-dibromo-3-nitrpropionamide, glycerine (550 gallons). These substances are in use as biocides and process reagents.
- Elemental gasses (nitrogen and argon)
- Petroleum products (#6 fuel oil (50,000 gallons), lubricating and hydraulic oil (1,000 gallons), diesel fuel (500 gallons), propane (20,000 gallons), compressed natural gas).
- Inorganic process reagents (diammonium orthophosphate (5,000 pounds), aluminum sulfate (5,500 gallons), copper-based pigment (300 gallons), ammonia (300 gallons), carbon black (500 gallons)), urea (3,000 pounds).
- Acids and bases (acetic acid (500 gallons), sulfuric acid (300 gallons), sodium hydroxide (2,000 gallons), potassium hydroxide (1,000 gallons)).

The #6 fuel oil is stored in two 25,000-gallon USTs on the east side of the plant. These USTs have interstitial monitoring and cathodic protection, with spill protection consisting of a bermed area around the fill ports.

Diesel fuel is stored in a 500-gallon steel AST in the same location as the #6 fuel oil USTs. The AST is double walled, but no spill containment was noted around the dispensing unit.

Propane is stored in an approximately 20,000-gallon AST at the south end of the clarifier. Compressed natural gas is stored inside box trailers that are replaced on an as-needed basis by NRG, the gas supplier.

Sodium hypochlorite is used to disinfect process river water, and is stored in a vertical AST inside the north end of the sand filter house.

Various aerosols were noted inside the maintenance shop, and are used to lubricate and cut various components. LEE did not observe chlorinated solvents inside the building.

A 100-gallon naphta parts washer is present inside the maintenance shop. The parts washer appeared to be in good condition and no significant evidence of spillage was noted in its vicinity. The parts washer is serviced by Safety Kleen.

A standby power generator is located at the south end of the office building. According to plant personnel, this generator is used when the power goes out to keep essential plant functions operating. The generator has an integral diesel fuel tank, which showed no signs of leakage.

C. Storage Tanks (Section 9.4.2.4): Identify ASTs and USTs on the subject property. Note pumps, fill pipes, vents, access ways, concrete pads, saw cuts in paved areas, etc. Determine location, size and construction material to the extent visually identifiable, apparent contents, spill/ release protection, containment measures, status (active or inactive). Note upgrades such as corrosion protection, spill and overfill protection, secondary containment systems, etc. Note visual evidence of whether tank(s) have been taken out of operation, removed, closed in place, or otherwise closed.

Underground Storage Tanks

Visual evidence of two USTs was observed. Two, 25,000-gallon USTs used to store #6 fuel oil for backup plant heat are registered to the property. There were other USTs on the property that were removed in 1988 and in 1990 but no visual evidence of these was noted.

Above Ground Storage Tanks

There are numerous ASTs at the property, both inside and outside the buildings. A summary is as follows. All of the ASTs appeared to be in good condition and no indications of failure or leakage were noted.

- Exterior ASTs (3)
  - One, approximately 20,000-gallon propane AST next to the clarifier building, used to fuel forklifts.
  - One, approximately 500-gallon diesel fuel AST near the fuel oil USTs and the CNG station.

- One, approximately 8,000-gallon AST formerly used to store vegetable oil, now unused, outside the east wall of the plant.

- Interior ASTs (15)
  - One, 5,000-gallon sulfuric acid AST in the bulk storage room.
  - Two, 3,000-gallon ASTs, two, 5,000-gallon ASTs, a 2,000-gallon AST and a 400 gallon AST used to store process reagents in the bulk storage room.
  - One, 8,000-gallon AST and one 5,600 gallon AST used to store process reagents in the stock preparation area.
  - One, 5,000-gallon AST and two, 3,000-gallon ASTs in the coating area used to store process reagents.
  - Two ASTs used to recycle slurry water in the filter stock area.
  - One, approximately 3,000-gallon AST in the sand filter house that is used to store sodium hypochlorite for disinfection.

There are many 2-300 gallon portable tote containers throughout the plant that are used to store process reagents, dyes, and treatment chemicals that are not considered ASTs due to their portability.

D. Odors (Section 9.4.2.5): Note strong, pungent, or noxious odors and attempt to identify source.

No strong, pungent or noxious odors were noted. Substantial amounts of steam were present in the wet end process area.

E. Pools of Liquid (Section 9.4.2.6): Note standing surface water, and pools or sumps containing liquids likely to be hazardous substances or petroleum products, to the extent visually identifiable.

Puddles of water were noted on the plant floor in proximity to the paper rolling operation, where the pulp was being dewatered. This is a normal part of the production process, and the water is conveyed through floor drains and downspouts to the basement sumps.

Water was present in a sump at the north end of the plant. Reportedly, this sump has had fuel oil in it before, and the side walls were stained black with apparent fuel oil. Six sorbent pads were deployed on the water surface, and had a reddish black stain indicative of possible fuel oil.

F. Drums (Section 9.4.2.7): Identify drums potentially containing hazardous substances, petroleum products, pollutants, or contaminants. Identify storage methods including whether release protection measures are in place. Are adverse environmental conditions such as leakage, weeping or overfilling observed? If drums are identified, indicate whether they are labeled and identify drum contents according to labeling.

Drums, totes and pails were identified throughout the plant, and outside of the plant. Containers inside the plant are in use for storage of oils and process reagents. Generally, the interior container storage practices were adequate, with no indication of adverse conditions. Drums were concentrated in the following areas:

- Satellite hazardous waste collection drums were noted at several locations. These were well labeled, although some were being used as tables and/or to accumulate supplies.
- Approximately 20, 55-gallon drums labeled "Castrol" were in use and being stored in the finishing area. These drums contain lubricating oil for plant machinery. Approximately seven of these drums were in use and the in-use drums were on containment pallets. Little or no floor staining was noted.
- Approximately 4, 55-gallon drums labeled "Castrol" were present in an oil recovery area near the bulk chemical storage area. These drums appear to be used to contain oil recovered from machinery under repair. The oil recovery was taking place over a containment pallet.
- Two, 55-gallon drums were present inside a flammable materials storage cabinet. The drums were labeled "AEM 5772 Antimicrobial" Quaternary Ammonium Salt, with "Flammable" and "Toxic" labeling. The drums were grounded, presumably to reduce the risk of sparks. No secondary containment was noted.
- Approximately 50, 55-gallon drums and a similar number of 5-gallon pails were present in the raw materials storage area. These contained dyes and other process reagents.
- A single 55-gallon steel drum was noted on its side in the wooded area past the boneyard. The drum was labeled "Sartomer" and appeared to be at least partially full. The drum was in poor condition, with corrosion and weathering noted.
- Approximately 20-30 55-gallon steel and plastic drums were being stored outside on pavement and on pallets at the north end of the paper plant. The labeling on the drums was widely variable, and it appeared that these were recycled drums from inside the plant. According to plant personnel, these drums contained spent sand from the sand filter house, and are awaiting disposal.

G. PCBs (Section 9.4.2.10): List suspect sources of polychlorinated biphenyls (PCBs) such as electrical or other equipment with potential to contain PCBs (transformers, circuit breakers, capacitors, hydraulic fluids, pesticide extenders, lubricants, cutting oils, vacuum pumps, heat transfer systems, plasticizer applications).

Three PCB transformers are present at the facility. Two of these are in transformer houses on the roof of the paper plant and the third is inside a transformer house near the maintenance shop. All three transformers were inspected and no leaks were seen. Facility staff inspects the transformers regularly for indications of leaks, and the oil is tested for signs of explosive gas generation that could result in a release. Several other transformers at the facility have reportedly been tested and were found to not contain PCBs at regulated concentrations.

There is an elevator located in the office building portion of the plant that was installed in 1997 and consequently is too new to be at risk of containing PCBs.

The age of the original building (1960s-70s) suggests that those portions could be at risk of having PCBs in paint and caulk.

Approximately one dozen electric overhead cranes are present in the production areas. These cranes are used to convey heavy objects across the plant. Some of the cranes in the older parts of the building may contain PCB oils due to their age. No obvious leaks or spills were observed from the plant floor.

In the "boneyard" portion of the property, numerous out of service electric motors, tanks, piping, valves, and other supplies are stored. Many of these objects appear to be quite old and could contain PCB oils.

Section 3. Interior Observations (ASTM E-1527-13 Section 9.4.3)

A. Heating/Cooling (Section 9.4.3.1): Identify current fuel source(s) for heating and cooling. If possible to identify past fuel sources for heating and cooling, list these also.

The plant is heated with steam from a boiler installation in the main plant. The boiler currently runs on compressed natural gas. Previously, the boiler ran on #6 fuel oil, which is now used as a backup source of fuel.

B. Stains/Corrosion (Section 9.4.3.2): Identify stains or corrosion of floors, walls, or ceilings except for staining from water.

Staining and some corrosion were present on the floors in the paper rolling area due to constant water discharge from the paper press. Some of the water appeared to have dye in it.

C. Drains and Sumps (Section 9.4.3.3): Identify floor drains, other drains, ditches, and sumps interior to buildings. Note the presence or absence of wastewater or other liquid discharge, and sediments, in or into these structures. Describe whether flowing or pooled, sheens, color, odor. Note processes active in their vicinity and whether drains are sealed or operational. Can discharge pipes be seen and if so, note the direction they exit the floor drain. Do drains daylight on the property?

Floor drains were noted throughout the wet end paper production area. These drains convey water liberated from the pulp slurry during pressing and rolling, downward through downspouts to the basement sumps. From there, the sumps convey the discharge to the wastewater treatment plant. During the site reconnaissance, the water flowing through the drains and sumps appeared to be clear, with no indication of oily sheens or odors.

Section 4. Exterior Observations (ASTM E-1527-13 Section 9.4.4)

A. Pits, Ponds and Lagoons (Section 9.4.4.1): Note pits, pools, ponds, lagoons, sumps, or catch basins and indicate location on site sketch map and indicate whether they appear to have been used in connection with waste disposal or treatment.

There is a large wastewater lagoon (about 160' x 700') that is divided into four sections. The lagoons are designed to aerobically treat the plant's process wastewater. The effluent from the lagoons is conveyed to the clarifier building, which polishes the water quality and extracts the sludge from the discharge prior to its discharge to the Connecticut River.

B. Stained soil or pavement (Section 9.4.4.2): Note stained soil or pavement.

A yellow stain was noted in the boneyard adjacent to equipment that appeared to have hydraulic hoses attached. No other significant exterior staining was noted, however, the ground outside of plowed area was covered in snow, which obscured the ground surface.

C. Stressed Vegetation (section 9.4.4.3): Note areas of stressed vegetation from cause other than lack of water and indicate location on site sketch map.

Stressed vegetation was not observed, although snow obscured most of the ground surface. An area of stressed vegetation noted in the 2015 Phase I ESA was located but was also covered in snow so its present status could not be determined.

D. Solid Waste (Section 9.4.4.4): Note landfills for solid waste or hazardous waste and whether active or abandoned. Note presence of trash and/or construction debris. Note areas that are apparently filled or graded by non-natural causes or filled with material of unknown origin, mounds, or depressions suggesting solid waste disposal.

There is an area at the north end of the cornfield that exhibits hummocky terrain, and exposed waste materials at the ground surface. This area corresponds to the 1989 survey map of the property that indicated "active fill area." Materials observed included concrete, rebar, asphalt, and plastic piping.

E. Drains and Waste Water (Section 9.4.4.5): Describe wastewater or other liquid (including storm water) discharge into drain, ditch, or stream on or adjacent to the subject property. Note the condition of wastewater or liquid discharge (e.g., water flowing or pooled, sheens on the liquid surface, color, odor)

No wastewater was observed outside of the buildings and the treatment lagoons. There are several storm drains in the parking lot, which appeared to be dry.

F. Wells (Section 9.4.4.6): Note active or inactive wells on the subject property (including oil or gas wells, injection wells, irrigation wells, groundwater monitoring wells, dry wells, abandoned wells, or other wells) and indicate location on site sketch map.

Two steel wellheads were observed in the landscaped grassy area across the road from the office building. According to plant personnel, these two wells are the backup sources of production water for the paper plant, which are used when the sand filter house or other components of the river water system are being worked on.

Several steel wellheads were observed in the cornfield area. These are believed to be associated with the WSWMD landfill on the adjoining property to the northwest.

LEE looked for, but did not find, evidence of the existing groundwater monitoring wells associated with the 1990 fuel oil release. There were reportedly 14 wells

installed during that effort, but none of them were visible. There is no record of their abandonment, and it is possible that the wells were paved over and are still present.

G. Septic Systems (Section 9.4.4.7): Indicate whether evidence exists of on-site septic systems and/or cesspools, to the extent visually identifiable.

The wastewater pumping system apparatus has a ground-level vault on the east side of the parking lot that is visible on the ground surface.

H. Limitations (Section 9.2.4): Identify condition(s), which prevented thorough inspection of building interiors, and/or property grounds (snow cover, denied access, safety or structural issues).

Snow covered the unplowed ground surfaces, which limited LEE's ability to see staining and / or stressed vegetation if it existed.

I. Additional Site Reconnaissance Observations: This section is used to describe other contract specific requests not addressed above, whether ASTM or non-ASTM criteria are used to evaluate the specific feature (Attach additional pages as needed.)

No additional services were requested.

APPENDIX D

INTERVIEW DOCUMENTATION

Date: November 28, 2018

Site Name: Neenah Northeast LLC

Location: 161 Wellington Road, Brattleboro, Vermont

With: Robert Murphy, Engineering Director
Punjan Tejani, Environmental Compliance Manager

Affiliation: Property owner representatives

Contact Info: (802) 257-5949

Section 1. General Site Setting (ASTM E-1527-13 Section 9.4.1)

A. Current uses of the property (Section 9.4.1.1): Describe current property uses with emphasis on those likely to involve use, treatment, storage, disposal and/or generation of hazardous substances and/or petroleum products. Include an estimate of the subject property boundaries. Include detail sketches if appropriate. Describe structures and other improvements on the property.

The property hosts an operating paper mill employing approximately 100 people. The mill accepts pulp and recycled paper from outside sources, and manufactures a 7-ply hard stock product suitable for report covers and similar applications. Typically, the inner plies are made of lesser quality fiber and the outer plies are better quality. Hazardous substances and petroleum products are used throughout the mill for process reagents, dyes, lubricants, fuels, disinfectants, and flocculants. Bleaching is not performed at the plant. There are no known sources of PFAs used in the process.

B. Past uses of the property (Section 9.4.1.2): Describe past property uses with emphasis on those likely to involve use, treatment, storage, disposal and/or generation of hazardous substances and/or petroleum products.

The paper mill was originally constructed in 1960, and was added onto several times. Before 1960, the property was undeveloped.

C. Current and past uses of adjoining properties (Section 9.4.1.3 and 9.4.1.4.): List current uses of adjoining properties with emphasis on those likely to indicate recognized environmental conditions on the subject property. If past uses of adjoining properties with such potential are evident list these also.

Commercial properties and a closed landfill.

D. Current or past uses in the surrounding area (Section 9.4.1.5): Describe general area development with potential to indicate recognized environmental conditions with the subject property.

Brattleboro industrial zoned area.

E. Geologic, Hydrogeologic, Hydrologic and Topographic Conditions (Section 9.4.1.6): Describe the overall property setting. Describe natural bodies of water (including springs and seeps) and possible wetlands on subject property and indicate location(s) on site sketch map. Note presence of exposed bedrock on property grounds and indicate general location(s) on site sketch map.

Flat, well drained site, no wetlands or bedrock.

F. General Description of Structures (Section 9.4.1.7): Describe structures or other improvements on the property including number and size of buildings, footprints, number of stories each, approximate age of buildings, occupancy status, pavement, fences, foundations/ruins, utilities, product pipelines, and ancillary structures such as railroad spurs and power transmission lines.

Paper mill building ~200,000 sf with a basement and 2nd story in parts of the building.

Clarifier building—final wastewater treatment for process water.

Sand filter house—filtration and disinfection of river water for process water ~1mm gallons/day.

G. Roads (Section 9.4.1.8): List public thoroughfares, roads, streets and parking facilities adjoining / on the subject property.

Wellington Road accesses the property.

H. Potable Water Supply (Section 9.4.1.9): Identify potable water supply source(s) for the subject property.

Provided by the Town of Brattleboro.

I. Sewage Disposal System (Section 9.4.1.10): Identify current sewage disposal system.

Mostly provided by the town of Brattleboro. There is a small septic system with a leachfield at the north end of the plant, which serves a bathroom at the north end of the plant. Formerly, there was an on site leachfield that served most of the plant, it was located east of the employee parking lot.

Section 2. Interior and Exterior Observations (ASTM E-1527-13 Section 9.4.2)

A. Current and Past Property Use (Sections 9.4.2.1 and 9.4.2.2): Describe.

Paper making.

B. Hazardous Substances and Petroleum Products and Unidentified Containers (Sections 9.4.2.3, 9.4.2.8 and 9.4.2.9): List apparent hazardous substances, petroleum products, pollutants, contaminants, unidentified containers and raw materials observed interior to any buildings. Include type, container size and quantity, locations and whether stored appropriately. Note presence or absence of labeling, content according to labels, drum condition.

See Tier 2 listings. LEE requested access to safety data sheets on 11/28 (renewed request on 12/4). The primary hazardous waste stream generated at the plant is oily rags. Universal wastes are also generated, including fluorescent light bulbs and ballasts.

C. Storage Tanks (Section 9.4.2.4): Identify ASTs and USTs on the subject property. Note pumps, fill pipes, vents, access ways, concrete pads, saw cuts in paved areas, etc. Determine location, size and construction material to the extent visually identifiable, apparent contents, spill/ release protection, containment measures, status (active or inactive). Note upgrades such as corrosion protection, spill and overfill protection, secondary containment systems, etc. Note visual evidence of whether tank(s) have been taken out of operation, removed, closed in place, or otherwise closed.

A listing of USTs and ASTs was provided in the Phase I ESA provided to LEE. The large propane AST is used to fuel the forklifts that operate throughout the plant.

D. Odors (Section 9.4.2.5): Note strong, pungent, or noxious odors and attempt to identify source.

None known.

E. Pools of Liquid (Section 9.4.2.6): Note standing surface water, and pools or sumps containing liquids likely to be hazardous substances or petroleum products, to the extent visually identifiable.

A sump near the boiler room accepts condensate and occasionally oil is released to the sump, which is absorbed with sorbent pads.

F. Drums (Section 9.4.2.7): Identify drums potentially containing hazardous substances, petroleum products, pollutants, or contaminants. Identify storage methods including whether release protection measures are in place. If drums are identified, indicate whether they are labeled and identify drum contents according to labeling.

Drums are present throughout the facility, for lubricants, process reagents, and waste products.

G. PCBs (Section 9.4.2.10): List suspect sources of polychlorinated biphenyls (PCBs) such as electrical or other equipment with potential to contain PCBs (transformers, circuit breakers, capacitors, hydraulic fluids, pesticide extenders, lubricants, cutting oils, vacuum pumps, heat transfer systems, plasticizer applications).

There are three PCB transformers on the property, which are closely monitored for leaks and accumulation of explosive gasses. No other PCBs are known.

Section 3. Interior Observations (ASTM E-1527-13 Section 9.4.3)

A. Heating/Cooling (Section 9.4.3.1): Identify current fuel source(s) for heating and cooling. If possible to identify past fuel sources for heating and cooling, list these also.

The plant is heated with a boiler that runs on compressed natural gas. Formerly it ran on #6 fuel oil. The fuel oil is now used as a backup source of heat. The conversion took place in 2014 and it resulted in a 70 ton per year reduction in particulate emissions.

B. Stains/Corrosion (Section 9.4.3.2): Identify stains or corrosion of floors, walls, or ceilings except for staining from water.

Floors are stained in places due to drainage and dyes.

C. Drains and Sumps (Section 9.4.3.3): Identify floor drains, other drains, ditches, and sumps interior to buildings. Note the presence or absence of wastewater or other liquid discharge, and sediments, in or into these structures. Describe whether flowing or pooled, sheens, color, odor. Note processes active in their vicinity and whether drains are sealed or operational. Can discharge pipes be seen and if so, note the direction they exit the floor drain. Do drains daylight on the property?

There are floor drains throughout the facility that accept water from the slurry dewatering process. This water is conveyed via downspouts to basement sumps, where it is piped to the on site wastewater treatment plant.

Section 4. Exterior Observations (ASTM E-1527-13 Section 9.4.4)

A. Pits, Ponds and Lagoons (Section 9.4.4.1): Note pits, pools, ponds, lagoons, sumps, or catch basins and indicate location on site sketch map and indicate whether they appear to have been used in connection with waste disposal or treatment.

There is a lagoon wastewater treatment plant on the property for process water. There are four lagoon sections, three of which are aerated. The final treatment is done at the clarifier, where pH is adjusted and sludge is extracted for reuse as landfill daily cover at other sites. The lagoons are lined.

B. Stained soil or pavement (Section 9.4.4.2): Note stained soil or pavement.

None known.

C. Stressed Vegetation (section 9.4.4.3): Note areas of stressed vegetation from cause other than lack of water and indicate location on site sketch map.

None known.

D. Solid Waste (Section 9.4.4.4): Note landfills for solid waste or hazardous waste and whether active or abandoned. Note presence of trash and/or construction debris. Note areas that are apparently filled or graded by non-natural causes or filled with material of unknown origin, mounds, or depressions suggesting solid waste disposal.

Solid wastes generated at the plant include scrap metal and wire. Waste paper is recycled into the process. No disposal of solid waste or sludge on the property has occurred.

E. Drains and Waste Water (Section 9.4.4.5): Describe wastewater or other liquid (including storm water) discharge into drain, ditch, or stream on or adjacent to the subject property. Note the condition of wastewater or liquid discharge (e.g., water flowing or pooled, sheens on the liquid surface, color, odor)

There are stormwater catch basins on the property that drain to the Connecticut River.

F. Wells (Section 9.4.4.6): Note active or inactive wells on the subject property (including oil or gas wells, injection wells, irrigation wells, groundwater monitoring wells, dry wells, abandoned wells, or other wells) and indicate location on site sketch map.

Two on site wells are used as a backup source of process water, most often after large storms when the river water is turbid, or in the wintertime.

G. Septic Systems (Section 9.4.4.7): Indicate whether evidence exists of on-site septic systems and/or cesspools.

There is a small septic system on the property that serves a bathroom at the north end of the plant. There used to be a septic system on the property next to the parking lot, but this was discontinued.

H. Helpful Documents (Section 10.8): Indicate whether any of the following documents are known to exist and if so, can copies of the documents be obtained within reasonable time and cost constraints?
   a. Environmental site assessment reports
   b. Environmental compliance audit reports
   c. Environmental permits
   d. Registrations for underground and above ground storage tanks
   e. Registrations for underground injection systems
   f. Material safety data sheets
   g. Community right to know plan
   h. Safety plans, SPCC plans
   i. Hydrogeological reports
   j. Governmental notices related to environmental violations or environmental liens
   k. Hazardous waste generator notices or reports
   l. Geotechnical studies
   m. Risk assessments
   n. Recorded activity and use limitations

There have been several Phase I ESAs and compliance audits done, which were provided to LEE.

H. Proceedings involving the Property (Section 10.9): Indicate any knowledge of pending, threatened or past litigation relevant to hazardous substances or petroleum products in, on, or from the Property; any pending, threatened or past administrative proceedings relevant to hazardous substances or petroleum products in, or from the property; and any notices from any governmental entity regarding any possible violation of environmental laws or possible liability related to hazardous substances or petroleum products.

None known.

In order to qualify for one of the Landowner Liability Protections (LLPs)187 offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "Brownfields Amendments"),188 the user must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. These inquiries must also be conducted by EPA Brownfield Assessment and Characterization grantees. The user should provide the following information to the environmental professional. Failure to conduct these inquiries could result in a determination that "all appropriate inquiries" is not complete.

(1.) Environmental liens that are filed or recorded against the property (40 CFR 312.25).

BDCC is currently not aware of any existing liens.

(2.) Activity and use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.26(a)(1)(v) and vi)).

Use limitations appropriate to local zoning.

(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).

No specialized knowledge or experience beyond the typical engagements of the regional development entity. The facility was built for it's intended use and has never been used by a user which chose to alter it's purpose / use.

(4.) Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29).

Due to the unique nature of the site and specific use, the purchase price seems to be accurate and represents a market valuation.

(5.) Commonly known or reasonably ascertainable information about the property (40 CFR 312.30).

Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example,

Below is a summary of findings from a Phase I which was completed in 2015.

- No. 6 Fuel Oil Plume from Former USTs:
  - There is a plume present and 10 monitoring wells were installed in 1990.
  - 1994 ground water study revealed free product in 3 wells, 7 wells were below applicable regulatory thresholds.
  - 1994 Letter from VTDEC to previous owner confirming the site had been granted a SMAC designation and no further action required.
  - Site part of VT Petroleum Cleanup Fund and should further work be required, only $10,000.00 deductible needed.
- Basement Sumps:
  - Potential cracks in sump may allow contaminants to reach subsurface.
- Current and Former Septic Tanks:
  - Until 2001, facility used a septic system which has now been decommissioned.
  - Remains a pass-through for Town's system
  - One currently active septic system
  - Potential soil impact related to current system due to draining from lab sings and maintenance floor drain.
- Potential Migration of Contamination from Off-site Property:
  - Property is downgradient of Windham Solid Waste District and C & S Wholesale which is currently a LUST site.
  - Monitoring wells in place
  - Site part of VT Petroleum Cleanup Fund and should further work be required, only $10,000.00 deductible needed.
- Other Findings:
  - Stressed Vegetation: 150-SF area on northwest side of wastewater treatment lagoons.
  - Former Unconfirmed UST: A 1999 referenced one former UST with unknown contents. No further information could be found be reporting or company files.
  - Former Unconfirmed Waste Oil Release: 1996 a release of waste oil was referenced in former, 2003 Phase I report. Previous owner (FiberMark) have no record of this release and no regulatory scrutiny to date

(6.) The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).
As indicated in the above summary, the degree of obviousness is moderate. The facility is in good shape for its age, however, it is and industrial site where chemicals have been used.

X3.1 In addition, certain information should be collected, if available, and provided to the environmental professional conducting the Phase I Environmental Site Assessment. This information is intended to assist the environmental professional, but is not necessarily required to qualify for one of the LLPs. The information includes:

This Phase I is being performed because there are known issues from a previous report, referenced above.

(b) the type of property and type of property transaction, for example, sale, purchase, exchange, etc.

The type of transaction is a purchase.

(c) the complete and correct address for the property (a map or other documentation showing property location and boundaries is helpful)

161-424 Wellington Road, Brattleboro, VT 05301

(d) the scope of services desired for the Phase I (including whether any parties to the property transaction may have a required standard scope of services or whether any considerations beyond the requirements of Practice E1527 are to be considered),

Phase I ESA per 1527-13, no additional services provided.

(e) identification of all parties who will rely on the Phase I report,

Brattleboro Development Credit Corporation, Long Falls Paperboard, LLC, Vermont Economic Development Authority, VT Agency of Commerce and Community Development, People's United Bank

(f) identification of the site contact and how the contact can be reached,

Robert Murphy, Engineering Director (802) 257-5949

(g) any special terms and conditions which must be agreed upon by the environmental professional, and

N/A

(h) any other knowledge or experience with the property that may be pertinent to the environmental professional (for example, copies of any available prior environmental site assessment reports, documents, correspondence, etc., concerning the property and its environmental condition).

Existence of 2015 Phase I, which has been provided.

Date: __November 21, 2018_____

Site Name: __Long Falls Paperboard_____

Location: __161 Wellington Road Brattleboro, VT,_____

User: __Long Falls Paperboard_____

Representative: ____Michael Cammenga_____

Contact Info: ___mike.cammenga@longfallsgroup.com, _____

In order to qualify for one of the Landowner Liability Protections (LLPs)187 offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "Brownfields Amendments"),188 the user must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. These inquiries must also be conducted by EPA Brownfield Assessment and Characterization grantees. The user should provide the following information to the environmental professional. Failure to conduct these inquiries could result in a determination that "all appropriate inquiries" is not complete.

(1.) Environmental liens that are filed or recorded against the property (40 CFR 312.25).

LFP is currently not aware of any existing liens.

(2.) Activity and use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.26(a)(1)(v) and vi)).

Use limitations appropriate to local zoning.

(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).

Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

No specialized knowledge or experience related to the property or nearby properties. LFP Principals are involved in the same line of business but do not have specialized knowledge of this property or nearby properties.

(4.) Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29).

LFP believes the purchase price represents a fair market value (equipment, land, and buildings are being purchased for $5 MM.) Any difference, if any, in price from fair market value, LFP does not believe is due to contamination at the property.

(5.) Commonly known or reasonably ascertainable information about the property (40 CFR 312.30).

The property was built for paper manufacturing and has continued in that use since it's construction. As an industrial manufacturing site, chemicals used for paper production have been used on the property. LFP does not have knowledge of specific chemicals that are or have been used at this property. LFP does not have knowledge of chemical spills at this property. LFP does not have knowledge of environmental cleanup at this property.

(6.) The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

LFP believes the degree of obviousness of the presence or likely presence of contamination at the property is comparable to other paper making facilities of similar age, maintenance and production.

X3.1 In addition, certain information should be collected, if available, and provided to the environmental professional conducting the Phase I Environmental Site Assessment. This information is intended to assist the environmental professional, but is not necessarily required to qualify for one of the LLPs. The information includes:

The Phase I is being completed in support of BDCC's acquisition of the property and participation in the BRELLA program which offers a liability exemption to regional development corporation.

(b) the type of property and type of property transaction, for example, sale, purchase, exchange, etc.

Purchase.

(c) the complete and correct address for the property (a map or other documentation showing property location and boundaries is helpful)

161 Wellington Road Brattleboro, VT 05301

(d) the scope of services desired for the Phase I (including whether any parties to the property transaction may have a required standard scope of services or whether any considerations beyond the requirements of Practice E1527 are to be considered),

Phase I is currently in process and scope is defined.

(e) identification of all parties who will rely on the Phase I report,

Brattleboro Development Credit Corporation, Long Falls Paperboard, LLC, Vermont Economic Development Authority, VT Agency of Commerce and Community Development, People's United Bank

(f) identification of the site contact and how the contact can be reached,

Michael Cammenga, Mike.Cammenga@longfallsgroup.com

(g) any special terms and conditions which must be agreed upon by the environmental professional, and

N/A

(h) any other knowledge or experience with the property that may be pertinent to the environmental professional (for example, copies of any available prior environmental site assessment reports, documents, correspondence, etc., concerning the property and its environmental condition).

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/01/2018 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 2 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 2 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

VT SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Vermont Hazardous Waste Sites List.

A review of the VT SHWS list, as provided by EDR, and dated 07/02/2018 has revealed that there are 8 VT SHWS sites within approximately 1 mile of the target property.

Comments:	Machine stopped working at 3am and cause IDed around 7am. Floor drain discharges to plant's on site WW system.
Action:	Plant personnel deployed sorbent boom/pad in the primary clarifier. Also deploying additional boom downgradient in the system as a precaustion to prevent discharge outside the WW system. Will call back as needed if the situation changes and also when rele

A8 **NEENAH** **VT UST** **U003194476**
Target **161 WELLINGTON ROAD** **N/A**
Property **BRATTLEBORO, VT 05301**

Site 8 of 12 in cluster A

Actual: 281 ft.

UST:

Facility:
Facility ID: 1020
Facility Status: ACTIVE
Sites Id: 900482
Pin: NS94-0007.05
Permitted To: Tank Owner
Landowner: Neenah Northeast LLC
Permit Expires: 10/1/2022 12:00:00 AM
Fee Status: Not reported
Tanks Pulled: Not reported
Site Code: Not reported
Removed: Not reported
Receipt: 0495
Owner Name: Neenah Northeast LLC
Owner Person: Pujan Tejani
Owner Address: 161 Wellington Road
Owner City,St,Zip: Brattleboro, VT 05301
Owner Telephone: 802-257-5904
Operator Name: Neenah Northeast LLC
Operator Person: Robert Murphy

NEENAH (Continued) **U003194476**

Operator Address: 161 Wellington Road
Operator City,St,Zip: Brattleboro, VT 05301
Operator Telephone: 802-257-5904
Groundwater Monitoring Wells: Not reported
Vapor Monitoring Points: Not reported

Tank Data:
Tank ID: 9857
Tank Status: PULLED
Tank Label: 1962-1-R
Tank Protect: Not reported
Year Removed: 1990
Capacity (Gal): 25000
Category One: UST
CP Test: Not reported
Release Monitor: Not reported
Condition: LUST
Date Reference: 1990

Compartment:
Comp Id: 9895
Compartment Label: A
Substance: Fuel Oil #5 or #6
Spill: Not reported
Overfill: Not reported

Piping:
Pipe Seq: 1
Pipe Type: DEFAULT
Pipe Installation Year: Not reported
Pipe Protection: Not reported

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No

FIBERMARK (Continued) **1000885134**

Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Date form received by agency: 03/14/2002
Site name: FIBERMARK, INC.
Classification: Large Quantity Generator

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002

FIBERMARK (Continued) **1000885134**

. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

AIR EMISSIONS CLASSIFICATION UNKNOWN

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

COMPLIANCE AND EMISSIONS REPORTING

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain

FIBERMARK (Continued) **1000885134**

limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

AIR MAJOR

HAZARDOUS WASTE BIENNIAL REPORTER

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D019
. Waste name: CARBON TETRACHLORIDE

. Waste code: D039
. Waste name: TETRACHLOROETHYLENE

. Waste code: D040
. Waste name: TRICHLOROETHYLENE

. Waste code: VT03
. Waste name: VT03

Classification: Conditionally Exempt Small Quantity Generator

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D039

Environmental Interest/Information System

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

AIR EMISSIONS CLASSIFICATION UNKNOWN

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

US EPA Air Quality System (AQS) contains ambient air pollution data collected by EPA, State, Local, and Tribal air pollution control agencies from thousands of monitoring stations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Historical Generators:

Classification: Small Quantity Generator

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Date form received by agency: 11/21/2006
Site name: ENTERGY NUCLEAR VERMONT YANKEE LLC
Classification: Conditionally Exempt Small Quantity Generator

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

LUST:

Facility ID:	20093895
Source:	UST-Diesel
Closure Date:	05/22/2009
Priority:	SMAC - Site Management Activities Completed
Staff:	Ashley Desmond
Source:	UST-Diesel
Site Use:	Business
Site Status:	Voluntary Action
Contamination:	Diesel
Institutional Control:	Land Record Notice
Record Last Update:	05/27/2009
Project Status:	Contamination discovered during the removal of diesel USTs. After the removal of approximately 400 cubic yards of contaminated soil, it appeared that only minor contamination remained. No groundwater impacts noted during the soil removal. A notice to the land record has been filed to document residual contamination. This property is located in an industrial park. All properties in the area are served by the municipal drinking water system.

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Historical Generators:
Date form received by agency: 07/27/2015
Site name: PENSKE TRUCK LEASING CO LP
Classification: Conditionally Exempt Small Quantity Generator

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

FINDS:

Registry ID: 110005294788

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D039

LEADER BEVERAGE/PEPSI COLA (Continued) **S103869394**

Contamination: Gasoline, MTBE, Non-Petroleum
Institutional Control: Not reported
Record Last Update: 10/13/2016
Project Status: Petroleum UST & PCE contamination. Annual GW sampling for all VOCs next round in May 2014. May have site-wide GW compliance. PCS treated & thin-spread onsite. PCE investigation may still need additional work. No VOC impacts to Vermont Natural Water supply well (WSID - VT0008404, Facility WL001) see reports at http://saturn/ReportServer/Pages/ReportViewer.aspx?2fDEC2fWater_Supply2fTWERP2fTWERP&rc:UniqueGuid=3Cnewguid3E&rs:Command=Render. Barrows Coal is going out of business. They have sold or are selling all of their gas stations. Some will continue selling gas, others will convert to auto repair only. They will be running their heating oil business through winter, but in spring 2013 will be getting out of that business.

Validation Report:	Note: the entered description for NAICS code 325510 differs from the official description in NAICS 2012. Entered description: Official description: Paint and Coating Manufacturing ---------- Validation Errors for Chemical: DIETHYLENE GLYCOL MONOBUTYL ETHER One of the check boxes, solid, liquid or gas, must be checked. ---------- Validation Errors for Chemical: Chemical Name is required for submission. EHS (Extremely Hazardous Substance) must be specified as either "Yes" or "No". One of the check boxes, pure or mixture, must be checked. One of the check boxes, solid, liquid or gas, must be checked. Maximum Amount Code is required for submission. Average Amount Code is required for submission. Storage Location information is required for submission. ---------- Validation Errors for Chemical: ETHYL ACETATE One of the check boxes, solid, liquid or gas, must be checked. ---------- Validation Errors for Chemical: HI Sol 10 One of the check boxes, solid, liquid or gas, must be checked. ---------- Validation Errors for Chemical: METHYL N-AMYL KETONE One of the check boxes, solid, liquid or gas, must be checked.

Reported By Work Phone:	Not reported
Reported By Home Phone:	Not reported
Incident Code:	Not reported
Incident Type:	No accident - saddle tank punctured by road debris.
Date Of Incident:	Not reported
Time Of Incident:	Not reported
Product:	Not reported
Quantity:	20 Gallons
Unit Of Measure:	Not reported
Responsible Party:	Ryder Transportation Services
RP Address:	Not reported
RP City,St,Zip:	Not reported
RP Phone Work:	Not reported
RP Phone Home:	Not reported
RP EMail:	Not reported
EMail Sent Status:	Not reported
Case Assigned To:	Not reported
Surface Water Affected:	Not reported
Date Closed:	**12/04/2015**
Closure Desc:	Not reported
UST Facility Id:	Not reported
Lat/Long:	Not reported
Comments:	Diesel spilled in parking lot. Rain has spread sheen/product over a 50'x100' area and into catch basin. Discharge point of system unknown but presumes to enter municipal system on Putney Road. ECS to confirm. To be closed pending confirmation of storm sew
Action:	Speedi dry deployed to pavement. Booms installed in catch basins, and oily water and sheen removed with a vac truck. Flow in basins ceased shortly after rain ended. Several booms left in most downgradient basin. ECS to perform follow-up inspection after/d

Site name: HOME DEPOT USA 4552
Classification: Small Quantity Generator

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D016
. Waste name: 2,4-D

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/07/2016

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 03/01/2018

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated
RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

1.0 INTRODUCTION

This report details the investigation of subsurface petroleum contamination at the Specialty Paperboard Mill, in Brattleboro, Vermont. The investigation was conducted by Griffin International, Inc. for Specialty Paperboard. The investigation was initially conducted to determine the extent of subsurface petroleum contamination in the vicinity of two underground #6 oil storage tanks at the Brattleboro facility. During the course of this investigation, the objectives were expanded to include the determination of the extent and possible sources of chlorinated compounds, BTEX and MTBE which have been detected in the groundwater.

2.0 SITE BACKGROUND

2.1 Site Description

The Specialty Paperboard Mill is located in Brattleboro, Vermont, on the west bank of the Connecticut River, approximately 2.25 miles north of the downtown business district (see Site Location Map, in Appendix A). The mill is situated approximately 320 feet west of the river on a broad terrrace which is normally 70 feet above river level. Land uses in the immediate vicinity of the mill consist of a mixture of industrial and commercial activities.

According to the Surficial Geologic Map of Vermont, the unconsolidated deposits beneath the mill consist of fluvial sands deposited in the Connecticut Valley Lake following the retreat of the continental glacier. The lake occupied what is now the Connecticut River Valley, and was formed by melt waters from the glacier. These melt waters carried a large sediment load which was deposited on the bottom of the lake in the form of a prograding delta. Once all the ice had melted, the land elevation began to rebound to its present level. As the lake level rose in relation to sea level, water flowing from the lake began to erode into the less resistant geologic formations, including the deltaic deposits near Brattleboro. Presently, the river channel is 70 feet below the lake bottom, in the vicinity of the paper mill.

This investigation has been conducted in response to a leak from one of two 25,000 gallon underground storage tanks which were used to store #6 oil for the mill's main boilers. The #6 oil has

contaminated these deltaic deposits in the vicinty of the tanks. The tanks were located on the east side of the plant building, near the door to the machine shop (see the Site Map in Appendix A for location of the tanks). Presently, there are two new underground tanks, used to store #6 oil, immediately southeast of the location of the leaking tank, which has since been removed. Both the tanks and the lines which transmit oil from the tanks, to the boilers, are continuously heated so that the viscous oil can flow through the pipes to the boilers.

2.2 Site History

On February 1st and 2nd, 1990, Specialty Paperboard excavated and removed two 25,000 gallon underground storage tanks (shown as "OLD TANKS" on the Site Map, in Appendix A). Upon removal of the tanks, a hole was noticed near the northern end of one of the tanks. At that time, it was determined that #6 six oil had been leaking from that hole into the surrounding soil. In response to this situation, Specialty Paper Board hired Soils Engineering, Inc. to drill soil borings in the vicinity of the old tanks to determine the extent of the soil contamination. Soils Engineering drilled a total of three soil borings on Febuary 15th and 16th. These borings are listed as MW-1, SB-1 and MW-2 on the Site Map.

MW-1 was installed near the leak in the one underground storage tank. The borehole for this well was advanced to a depth of approximately 72 feet below grade. Heavy petroleum contamination was detected in the soils retrieved from this borehole from a depth of 8 feet to a depth of 47 feet. SB-1 was drilled near the other end of the leaky tank. The borehole was advanced to a depth of 50 feet below grade. No petroleum contamination was detected in the soils retrieved from SB-1. MW-2 was drilled approximately 45 feet in the presumed downgradient direction of the leaky tank. There was no petroleum contamination detected in soils retrieved from MW-2 either. MW-1 and MW-2 are now monitoring wells. SB-1 was a soil boring which was backfilled at the completion of drilling.

From the information provided by these three boreholes, it was assumed that the highly viscous #6 oil had leaked from the heated tank and migrated downward through the soils to a depth of 47 feet. At that depth, it was assumed that the oil had lost enough

heat to make it too viscous to migrate any deeper. Since the heat source had been removed with the old tanks, it was assumed that the product would remain in the soils in a solid state, thereby resulting in the discontinuation of the migration of adsorbed contamination.

In response to this situation, the State of Vermont Department of Environmental Conservation sent a letter of notification to Specialty Paperboard on February 22nd, requiring that an additional assessment of the situation be conducted. Specifically, the DEC required that additional soil borings be drilled and an assessment be conducted to fully define the extent of the subsurface petroleum contamination and to develop plans to mitigate the contamination.

On May 3rd, Specialty Paperboard engaged Griffin International, Inc. to conduct this assessment. The original plan was to install one additional monitoring well and three additional soil borings. If significant concentrations of petroleum contamination were detected in the soil borings, Griffin was to install monitoring wells in the holes, as well. Once the wells were installed, Griffin was to collect and analyze samples from each monitoring well using EPA Methods 601, 602 and 418.1.

Drilling of these borings began on May 14th. The first hole drilled (MW-3 on the Site Map) was originally intended to be a soil boring, however, significant petroleum contamination was detected in the soils to a depth of 72 feet, requiring installation of a monitoring well in that hole. The second borehole (SB-2 on the Site Map) also contained significant amounts of contamination, but it was decided not to install a well in that hole. Soils retrieved from the third borehole, SB-3, contained no detectable petroleum contamination. Soils retrieved from the fourth borehole, MW-4, also contained no detectable petroleum contamination. A monitoring well was installed in this borehole as was originally planned.

Water samples were then collected from each of the four monitoring wells for laboratory analyses. The analyses indicated that the groundwater in the vicinity of the leaky tank contained chlorinated compounds, BTEX and MTBE, and total hydrocarbons. The data was presented to Specialty Paperboard on June 13th. At that point, Specialty Paperboard asked Griffin to resample the four monitoring wells on site, as well as three monitoring wells located on the northern end of their property, which were installed to monitor groundwater from the Windham Regional Solid Waste

Landfill. The landfill is adjacent to the Specialty Paperboard property.

3.0 INVESTIGATIVE PROCEDURES

3.1 Monitoring Well Installation and Soil Sampling

To more adequately define the extent of subsurface petroleum contamination, Griffin International drilled a total of four soil borings in the vicinity of the leaky underground #6 oil storage tank. The borings were drilled using a hollow stem auger drill rig with six inch inner diameter augers. Split spoon samples were collected from each borehole at regular intervals. Each sample was logged by the supervising hydrogeologist and screened for hydrocarbon vapors using a photoionization device. Soil characteritics and vapor concentrations are listed on the well logs in Appendix B.

Monitoring Well #3 (MW-3 on the Site Map) was installed to determine the eastward extent of the petroleum contamination. It was originally intended to be a soil boring with no well installed; however, heavy petroleum contamination in soils retrieved from this borehole necessitated installation of a monitoring well so that water samples could be retrieved for laboratory analysis. Soils retrieved from the borehole for this well consisted of mostly fine to coarse sand with a little silt. Thick, black petroleum contamination was detected in soils retrieved from a depth of 21.5 feet to 67 feet below grade. Hydrocarbon vapor concentrations in these soils ranged up to 38 ppm. The petroleum contamination apparently extends to the water table in this hole. The borehole was advanced to a depth of 80 feet below grade so that an appropriately constructed monitoring well could be installed. The well was constructed of 20 feet of 2 inch diameter, 0.010 inch slotted PVC well screen and 59 feet of well casing. A gravel pack was placed around the well screen to prevent silts from clogging the screen. A bentonite seal was installed above the gravel pack to prevent cross contamination of the groundwater from surface runoff. The well was completed with a four inch diameter road box which was grouted in place. The well log for MW-3 illustrates the construction details.

Soil Boring #2 (SB-2 on the Site Map) was drilled to a depth of 76 feet. Split spoon samples were retrieved from this hole in five foot

intervals. The split spoon samples retieved from this hole consisted of nearly horizontal stratigraphic sequences, each measuring approximately one foot thick. These stratigraphic sequences begin as coarse, well rounded, well sorted sand at the top and grade into fine, silty sand at the bottom. Thick, black petroleum contamination was observed in these samples beginning at a depth of 15 feet below grade and ending at 72 feet, approximately 4 feet below the water table. The contaminated soils were observed to be very warm to the touch with the warmest soil near the fifteen foot level. This heat is believed to be residual heat from the old tanks.

Near the top of the contaminated soil, the petroleum concentrations appeared to be thicker in the tops of the stratigraphic sequences, in the coarser sand, indicating that the petroleum migrates more freely through the coarser sands. Hydrocarbon vapors in these soils were measured up to 55 ppm. The borehole for SB-2 was backfilled with the drill cuttings and capped with a concrete plug.

Soil Boring #3 (SB-3 on the Site Map) was installed in a location which was assumed to be downgradient of MW-3. The borehole for SB-3 was extended to a depth of 72 feet. Split spoon samples were collected from this borehole at five and ten foot intervals. These samples also contained the same stratigraphic sequences as were observed in SB-2. The one foot sequences graded from coarse, well rounded, well sorted sand at the top to fine sand and silt at the bottom. No apparent petroleum contamination was observed in these soils.

Monitoring Well #4 (MW-4 on the Site Map) was installed as the assumed furthest downgradient well to the leaky tank. The borehole for this well was advanced to a depth of 85 feet. Split spoon samples were collected at five and ten foot intervals. These samples contained stratigraphic sequences similar to those found in SB-2 and SB-3. No apparent petroleum contamination was detected in these soils. The well was constructed of 25 feet of well screen and 58.5 feet of well casing. A gravel pack was installed around the screen and a bentonite seal was installed above the gravel pack. MW-4 was completed with a road box which was grouted in place.

3.2 Groundwater Flow Direction and Gradient Determination

The determination of groundwater flow direction and gradient is essential in determining both the paths and rates of migration of subsurface petroleum contamination. These determinations also help to identify any potential receptors of the contamination.

To determine both the groundwater gradient and the flow direction in the vicinity of the Specialty Paperboard Mill, the water table elevations in each well were measured relative to the tops of casings of each well. The depths to water in each well were then substracted from the surveyed elevations of the tops of casings to obtain water table elevations accross the site. The groundwater contour maps in Appendix A shows groundwater elevations, contours and flow directions. The Groundwater Contour Map for May 18th shows the groundwater flowing to the northeast at a 0.38% gradient. The Groundwater Contour Map for June 25th shows the groundwater flowing slightly more toward the north at a 0.33% gradient. The data for June 25th, 1990 suggests that the groundwater was flowing away from the Connecticut River towards the northwest at a 1.25% gradient. The flow direction in the vicinity of the old #6 oil tanks may be the result of a local area of higher water levels that extends away from the river.

The apparent direction of groundwater flow away from the river was not originally expected at the beginning of this investigation. Originally, we had assumed that the groundwater across the entire area flowed toward the river. There are many possible explanations for this occurance. To determine the exact explanation would require a lengthy and costly investigation which would serve little immediate use. The unexpected groundwater flow direction does present different problems than had been originally expected, however. Specifically the estimate of the most likely receptors of the subsurface petroleum contamination has changed. At the beginning of this investigation, we predicted that the Connecticut River would be the primary receptor of any dissolved and free phase petroleum which may have originated from the #6 oil in the unsaturated zone. However, available data indicates that the groundwater flow is to the northwest. In addition, previous subsurface investigations conducted for the Windham Regional Landfill, indicate that the Connecticut River is a loosing stream in the vicinity of the paper mill. Therefore, the potential receptor appears to be groundwater to the northwest of the paper mill.

Specifically, any water wells in that area may have the potential to collect contamination.

According to the Utilities Superintendant for the Town of Brattleboro, to his knowledge, there are only three active water wells in the immediate vicinity of the mill other than the mill's two supply wells. These wells are located at the Pepsi Bottling Plant, the Quality Inn Hotel and the Steak Out Restaurant, all three of which are located along Route 5 approximately 2,000 to 3,000 feet from the mill. At this time, there is insufficient data available to determine if these wells are receptors. All other homes and businesses in the immediate area are believed to be supplied by the Brattleboro municipal water system.

In addition to these wells, the Town has a series of backup supply wells located at the confluence of the West River and the Connecticut River, approximately 1.5 miles south of the mill. It is unlikely that contaminated groundwater could flow from the paper mill to these wells, due to the large distance it would have to travel.

The Town of Brattleboro uses a resevoir on the extreme western edge of the town as its primary water source. It is not likely that this resevoir could be affected by the petroleum contamination at the paper mill.

3.3 Groundwater Sampling and Analysis

On May 18th, 1990, Griffin collected samples of the groundwater from each of the four monitoring wells in the vicinity of the old tanks for laboratory analysis. These samples were analyzed using EPA Methods 601, 602 and 418.1. Results of the analyses can be found in Appendix C.

EPA Method 601 is used to quantify the concentrations of twenty-nine halocarbons, or chlorinated compounds. These compounds are not typically found in petroleum products; however, it is standard procedure for the Vermont DEC to require this analytical method to be run for water samples from a site with subsurface petroleum contamination. The lab results indicate that there were low concentrations of purgeable halocarbons in the groundwater in the vicinity of the old #6 oil tanks on May 18th. The Purgeable →?

large area of contamination centered near MW-2. The total concentrations of the various compounds listed in the lab results ranged from 21 ppb to 75 ppb on May 18th.

EPA Method 602 is used to quantify the concentrations of purgeable aromatic compounds in water. These compounds include benzene, ethylbenzene, toluene, xylene and MTBE. These compounds are all typically found in gasoline. Benzene, toluene, ethylbenzene and xylene may be present in #6 oil in low concentrations but it is unlikely that MTBE would be present. The lab results indicate that two of the four monitoring wells did contain purgeable aromatics on May 18th. MW-4 contained 1.78 ppb toluene. MW-3 contained a total of 387 ppb total aromatics, including 16.3 ppb MTBE which is a relatively new additive to gasoline. This data indicates that the groundwater contamination in the vicinity of the old #6 oil tanks may be at least in part the result of a release of gasoline to the subsurface.

EPA Method 418.1 is used to quantify the concentrations of all hydrocarbons, natural or manmade, in water. These compounds include all petroleum hydrocarbons, some chlorinated compounds and any other naturally occuring hydrocarbons such as methane. The lab results indicate that the groundwater in the vicinity of the old #6 oil tanks contained significant concentrations of hydrocarbons on May 18th. The Total Hydrocarbons in Groundwater Map, in Appendix A, illustrates the contamination plume which was centered in the vicinity of MW-3 on May 18th. The concentrations of petroleum hydrocarbons in these wells are typical of levels found in groundwater which is in contact with free petroleum product.

These analytical results were presented to Specialty Paperboard on June 13th, at which time, they requested that Griffin resample the four, on site, monitoring wells as well as three monitoring wells on the northern end of their property. These three wells were previously installed as part of the groundwater monitoring program for the adjacent landfill. Water samples from these wells were analyzed to determine the possibility that the chlorinated compounds, which were detected in the four monitoring wells near the old tanks, were originating from the landfill. In addition to these three wells, Specialty Paperboard also requested that Griffin sample one of the two drilled wells that supply the mill with cooling and process water during the summer months.

The second round of water samples was collected on June 25th.

Groundwater samples were collected from six monitoring wells, MW 1, MW-2, MW-3, MW-5, MW-6 and MW-7, and one of the two supply wells for the paper mill. A sample was not collected from MW-3 due to the presence of free floating petroleum. Analytical results, which can be found in Appendix C, indicate that there were still low concentrations of purgeable halocarbons (chlorinated compounds) in the vicinity of the old #6 oil tanks on June 25th. MW-1, MW-2 and MW-4 all contained chlorinated compounds on that date. These concentrations are similar to the concentrations detected in the groundwater on May 18th. Additionally, there were chlorinated compounds present in two of the three monitoring wells which were installed to monitor groundwater from the Whindam Landfill. MW-6 contained a total of 168.85 ppb of chlorinated compounds while MW-7 contained a total of 1.37 ppb. MW-5, which is also a monitoring well for the landfill, contained no halocarbons on June 25th. Water sampled from one of the two supply wells for the mill contained no detectable chlorinated compounds on that date.

The three landfill wells, which were sampled on June 25th, are sampled once a year by the Windham Regional Solid Waste District as part of its compliance program required by the State of Vermont Solid Waste Management Division. The most recent sampling date for that program was September 22, 1989. Analytical results for samples collected from these wells on that date indicate that groundwater in MW-5 contained a total of 19 ppb chlorinated compounds while MW-6 contained a total of 68 ppb. The chlorinated compounds detected in these wells on that date are consistant with the compounds detected in the samples collected on June 25th from these wells. MW-7 contained no detectable chlorinated compounds on that date.

In addition to being analyzed for chlorinated compounds, the water samples collected on June 25th were also analyzed for BTEX and MTBE, using EPA Method 602, and for total hydrocarbons, using EPA Method 418.1. Results of these analyses indicate that MW-6 contained 11.80 ppb benzene and 1.84 ppb toluene. Additionally, MW-7 contained 61 pprn total hydrocarbons. All other wells sampled on that date contained no detectable levels of BTEX, MTBE, or total hydrocarbons. The lack of hydrocarbons in the groundwater near the old tanks on June 25th contrasts with the presense of significant concentrations on the sampling date, May 18th.

Possible sources of these chlorinated compounds could include the landfill, industrial plants in the vicinity of the paper mill or waste disposed of in the past along the river bank. A review of aerial photographs of the area and a visual inspection of the site uncovered no evidence that dumping of contaminants in this area has occured in the past. The BTEX and MTBE which was detected in the groundwater near the old tanks may have originated from an underground gasoline storage tank which was removed from the vicinity of the new #6 oil tanks approximately three years ago. Information regarding this tank is limited. It is possible that this tank may have been leaking or that overfills resulted in inadvertant spills which may account for the presence of these compounds in the groundwater. The Specialty Paperboard Mill does not currently use chlorinated compounds in its manufacturing processes, however, prior to 1988, small amounts were used in various maintenance procedures. It is possible that inadvertant releases of these compounds may have resulted in the presence of subsurface chlorinated contamination.

4.0 CONCLUSIONS

Based on the above observations made during the initial subsurface investigation, Griffin International has reached the following conclusions regarding subsurface petroleum and halocarbon contamination at Specialty Paperboard:

1. There was a release of #6 heating oil to the subsurface, from a leak in one of the two underground storage tanks. The amount and duration of the release have not been determined. The release has resulted in contamination of soils in the vicinity of the tank. Most of the contamination is contained in the unsaturated zone and extends approximately 70 feet to the water table in some locations. Some of the contamination is presently floating on the water table and over time, the amount of floating product could increase. It is assumed that the leaky tank was the only source of the #6 oil contamination. That source was removed in February, 1990. The adsorbed contamination is periodically providing a source of dissolved hydrocarbon contamination in the groundwater. As precipitation percolates through the adsorbed contamination and, as groundwater comes in contact with it, hydrocarbons slowly become liberated into the dissolved phase resulting in

2. In addition to #6 oil contamination, there are also low concentrations of chlorinated compounds and compounds typically found in gasoline. These compounds have been found in the groundwater, both in the vicinity of the old #6 oil tanks and in two of the three landfill monitoring wells. Their source(s) have not yet been determined.

3. The soils in the area of concern are of deltaic origin and consist of one foot thick stratigraphic sequences. The sequences consist of fine, silty sand near the bottom of each sequence and grade upward to coarser, well rounded, well sorted sand. The finer, silty sand likely has a lower permeability than the coarser sand.

4. Although our data are incomplete, we are concluding that the bedding planes, along which these stratigraphic sequences were deposited, are dipping, slightly, to the south, due to the general nature of deltaic deposits.

5. As the petroleum flowed into the surrounding soils, it tended to follow these bedding planes horizontally in the dip direction, as well as vertically. The horizontal migration has resulted in contamination of soils in the vicinity of SB-2. It also has resulted in the lack of soil contamination in MW-1 below a depth of 47 feet. Figure 1 illustrates these subsurface conditions.

6. Some of the subsurface #6 oil contamination has reached the water table. In areas where the contamination has reached the groundwater, there is free floating product and dissolved hydrocarbons.

7. The water table beneath the mill is at a depth of approximately 70 feet. On the two separate dates that groundwater measurements were taken, the data indicates that the groundwater was flowing toward the northeast in the vicinity of the #6 oil contamination. This appears to be a local phenomenon, however, as the overall water table measurements indicate that groundwater in the flows to the northwest. Because the water level in the river is two feet above the water table beneath the mill, it is likely that the river was loosing water to the aquifer at the time that the measurements were taken.

8. We have identified three possible off site receptors of the subsurface petroleum contamination. They are the water supply wells for the Steak Out Restaurant, the Quality Inn Hotel and the Pepsi Bottling Plant. Additionally, there are two on site supply well used for process water for mill operations. Due to the limited data at this time, it can not be determined which, if any, of these wells could be actual receptors. Because all other buildings in the area are assumed to be supplied by the municipal water system, it is unlikely that they will be impacted by the contamination, however, it is possible that other active water wells do exist in the area that the Brattleboro Utilities Superintendant is not aware of.

5.0 RECOMMENDATIONS

Griffin International presents the following recommendations for continued monitoring and remediation of subsurface contamination at Specialty Paperboard:

1. Due to the potential liability presented by the existance of such a large amount of petroleum product in the subsurface, it would be in the best interest of Specialty Paperboard to attempt remediation of the contamination. Griffin International has identified three possible remedial options for this site. They are 1) excavation of the contaminated soils, 2) pumping the contamination from the ground via a double pump or total fluid recovery system, 3) applying bioremediation to the site. Before an option is chosen, we recommend that thorough feasability studies be conducted for each method.

Excavation of the contaminated soils would involve digging an approximately 70 foot deep by 40 foot wide hole directly adjacent to the mill building. This method would require significant engineering design to minimize disruptions of mill operations. While this method would remove a large portion of the contamination, it would likely not account for all of it. Excavation of such a large hole would disrupt mill operations in the vicinity of the machine shop and could cause damage to the building and upset machine settings. Additionally, provisions would have to be made for proper disposal of the soils.

Removal of the contamination via a drilled recovery well and a double pump or total fluid recovery system, two standard techniques for remediating lighter end petroleum products, would likely be difficult, if not impossible, in this situation. The primary obstacle to the effectiveness of these remediation techniques is that they are primarily used in situations where the bulk of the subsurface petroleum contamination is in the free floating phase. At Specialty Paperboard, the bulk of the contamination is contained in the unsaturated zone. To pump it from the subsurface would require waiting for it to slowly migrate to the water table and then, to the recovery well. Additionally, any floating contamination would be difficult to pump back to the surface due to the high viscosity of #6 oil.

A bioremediation system would consist of a drilled groundwater pumping well, an above ground bio-treatment sytem and a nutrient and dissolved oxygen recharge gallery. This system would pump contaminated water from a location immediately downgradient of the contamination plume. The water would be pumped from the well to an above ground bio-treatment system. The bio-treatment system would consists of a fixed-film bioreactor and a nutrient feed system. The contaminated groundwater flow past the fixed film bioreactor which would result in a significant decrease in dissolved contamination levels. Once the water flows past the bioreactor it is sent to the nutrient feed system which adds dissolved oxygen, bacteria and nutrients to the water. The water is then reintroduced to the subsurface via a recharge gallery and one or two injection wells. The recharge of nutrient rich water into the soil matrix will stimulate the biological activity in the subsurface, effectively converting the subsurface into a large bioreactor system. Additionally, the flushing action of the recharge drives the more water soluable contaminants from the adsorbed phase to the dissolved phase which will then be captured by the recovery well and pumped through the above ground bioreactor for bioreaction. This approach could greatly reduce the time required for remediation when compared to a double pump or total fluid recovery system. The two disadvantages which should be considered with this technique are the amount of monitoring which would be required to assure the effectiveness of the process and the difficulties in adequately distributing the nutrients throughout the contamination plume.

2. Prior to remediation, it is recommended that the monitoring wells be sampled again for analysis using EPA Method 624. This method tests for the same compounds that Methods 601 and 602 test for but it uses a mass spec confirmation which tends to be more precise.

3. It is recommended that additional downgradient monitoring wells be installed to determine the downgradient extent of the groundwater contamination and to more adequately define groundwater gradient and flow direction.

4. To verify that the Connecticut River is a loosing stream and that groundwater in the vicinity of the mill flows toward the northwest, we recommend that all water levels across the site be resurveyed.

APPENDIX C	Groundwater Quality Data

I. INTRODUCTION

This report provides the analytical results for the August 1994 groundwater sampling event at the Specialty Paperboard site in Brattleboro, Vermont (see Site Location Map and Site Map in Appendix A). Groundwater sampling was conducted as per an August 9, 1994, verbal request from Mr. Richard Spiese of the Vermont Department of Environmental Conservation (VTDEC), consistent with the recommendation contained in an October 15, 1992 letter from Griffin to Mr. David Allen of Specialty Paperboard. Groundwater sampling and analyses were conducted to characterize the current extents of free phase product and dissolved phase, petroleum-related contamination at the site.

II. GROUNDWATER SAMPLING AND ANALYSES

On August 19, 1994, liquid levels were measured in ten onsite monitoring wells with an interface probe prior to groundwater sampling: MW-1, MW-2, MW-3, MW-4, MW-9, MW-11, MW-12, MW-14, MW-15, and MW-16. Liquid level data are presented in Appendix B. MW-17 was not able to be located and appears to have been paved over since it was last monitored in August of 1992. MW-13 was located on the adjacent property immediately to the north of Specialty Paperboard. However, the well cap on the above-ground protective casing for this well was secured with a padlock for which Griffin representatives had no key.

Free product was detected in three monitoring wells in the vicinity of the former No. 6 Fuel Oil tanks: MW-3, MW-15, and MW-16. The product was extremely viscous to nearly solidified and did not allow passage of the interface probe to determine product thickness. Water table elevations were plotted on a map of the site to generate a Groundwater Contour Map (Appendix A). Groundwater flow in the overburden aquifer at the site is generally directed to the south and southeast, toward the Connecticut River. This groundwater flow pattern is generally consistent with previous determinations.

Groundwater samples were collected from seven of the ten accessible wells on August 19, 1994. Presence of free product precluded sample collection in MW-3, MW-15, and MW-16. This was the first reported occurrence of free product in MW-16. Groundwater samples were analyzed by EPA Method 8240 for volatile organic constituents and by Method 418.1 for total petroleum hydrocarbons. Analyses were conducted by Endyne, Inc., of Williston, Vermont. Laboratory data sheets are provided in Appendix C. Results of the trip blank and duplicate samples indicate that adequate Quality Assurance/Quality Control was maintained throughout the sample collection and analysis program. An equipment blank was not submitted, as each sample was collected with either a dedicated or disposable bailer.

As presented in the attached laboratory data sheets, hydrocarbons were detected in four onsite wells: MW-14, MW-4, MW-10, and MW-9. Detection of hydrocarbons in MW-9 is not likely to be a result of the subsurface No. 6 Fuel Oil contamination along the southeastern wall of the

Specialty Paperboard building. MW-9 is nearly 700 feet cross-gradient from the No. 6 Oil plume. Hydrocarbons detected in MW-4, MW-14, and MW-10, are likely the result of the adjacent upgradient No. 6 Oil plume.

Analytical results were plotted on a map of the site to generate the attached Contaminant Distribution Maps, one for Total BTEX constituents and MTBE and one for Total Volatile Organic Compounds. With the exception of MTBE detected at 13.1 parts per billion in MW-11, no petroleum-related constituents were detected in the monitoring well samples. This concentration of MTBE in MW-11 is below the Vermont Health Advisory Limit (HAL) of 40 ppb for this constituent.

Very low concentrations of chlorinated hydrocarbons were detected in wells MW-14, MW-4, MW-1, MW-2, and MW-10, and in MW-12 located near the former landfill. Detected concentrations are similar in magnitude to those detected historically at the site. This contamination is believed to be the result of past storage and handling practices in the vicinity of the Maintenance Shop near the former No. 6 Oil tanks. None of the detected constituents (1,1,1-trichloroethane, trichlorofluoromethane, tetrachloroethene) was reported at concentrations above their respective EPA Maximum Contaminant Level (MCL) or VT HAL.

III. CONCLUSIONS

In summary, groundwater quality in the vicinity of the subsurface No. 6 Fuel Oil plume does not appear to be significantly impacted by dissolved petroleum constituents. BTEX compounds were not detected in groundwater samples from onsite wells sampled in August of 1994. MTBE was detected below the VT HAL in one well, in a location cross-gradient from the No. 6 Oil plume. The No. 6 Oil plume is relatively stable. Qualitative data collected during liquid level monitoring of onsite wells indicates that the product is extremely viscous. The periphery of the plume has likely cooled to temperatures which prevent substantial free phase product migration. Existence of this plume appears to pose little to no risk to nearby potential receptors, including the Connecticut River and Mill supply wells.

IV. RECOMMENDATION

Griffin recommends that the Specialty Paperboard site be considered for Site Management Activity Completed (SMAC) and removed from the VTDEC Active Hazardous Sites List based on the following criteria, as per the VTDEC SMAC Checklist:

1) The source(s), nature and extent has been adequately defined.

   The source of petroleum contamination detected in soil and groundwater at the Specialty Paperboard site was from one of two former underground storage tanks

(USTs) containing No. 6 Fuel Oil (see previous site investigation reports). Soil boring and groundwater quality data collected between 1990 and 1994 have indicated that the extent of contamination is primarily limited to the immediate vicinity of the former UST.

2) Source(s) has been removed, remediated, or adequately contained.

The two 25,000-gallon USTs containing No. 6 fuel oil were removed on February 1 and 2, 1990 and were replaced by two new USTs in accordance with VTDEC UST Regulations. No. 6 oil is an extremely viscous product which requires heating to flow from a storage tank through distribution lines. The No. 6 oil plume which leaked from the former heated UST has likely cooled significantly during the subsequent four years and the plume is relatively stable. Qualitative data collected during liquid level monitoring of onsite wells during August of 1994 indicates that the product is extremely viscous to nearly solidified. While the core of the plume may remain slightly warm with respect to ambient temperatures in the surrounding aquifer and substrate, the periphery of the plume has likely cooled to temperatures which prevent substantial free phase product migration. This assumption is consistent with the recent detection of free product in only three wells located proximal to the former UST.

3) Levels of contaminants in soil and groundwater shall be stable, falling, or non-detectable.

As stated above, the No. 6 oil plume is not likely to migrate especially with increased cooling of the oil to ambient temperatures. Thus soil contamination will be limited to the immediate vicinity of the former USTs. The August 1994 groundwater analytical results indicate that contaminant concentrations are either nondetectable or below applicable VT Groundwater Enforcement Standards.

4) Groundwater enforcement standards are met on entire property.

The August 1994 groundwater analytical results indicate that contaminant concentrations are either nondetectable or below applicable VT Groundwater Enforcement Standards.

5) Soil guideline levels are met. If not, engineering or institutional controls are in place.

Stockpiled soils contaminated with No. 6 Fuel Oil were removed from the site for Asphalt Batching in 1992. Surface soils are paved in the immediate vicinity of the former USTs.

6) No unacceptable threat to human health or the environment exists on site.

Due to the low level of groundwater contamination and the engineering controls described above, residual contamination that may be present in groundwater or soils at

the site does not pose an unreasonable risk to human health and safety or the environment.

7) Site meets RCRA requirements.

   Specialty Paperboard is not in violation of the Resource Conservation and Recovery Act (RCRA) as defined in 40 CFR 264.

8) Site meets CERCLA requirements.

   Specialty Paperboard is not in violation of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) as defined in 40 CFR 300.

REPORT OF LABORATORY ANALYSIS

CLIENT: Griffin International
PROJECT NAME: Specialty Paperboard
REPORT DATE: September 6, 1994
DATE SAMPLED: August 19, 1994

PROJECT CODE: GISP1384
REF.#: 63,373-63,382

Enclosed please find the results of the analyses performed for the samples referenced on the attached chain of custody.

Chain of custody indicated the samples were preserved with HCl.

All samples were prepared and analyzed by requirements outlined in the referenced method and within the specified holding times.

All instrumentation was calibrated with the appropriate frequency and verified by the requirements outlined in the referenced method.

Blank contamination was not observed at levels affecting the analytical results.

Analytical method precision and accuracy was monitored by laboratory control standards which included matrix spike, duplicate and quality control analyses. These standards were determined to be within established laboratory method acceptance limits.

Individual sample performance was monitored by the addition of surrogate analytes to each sample. All surrogate recovery data was determined to be within Laboratory QA/QC guidelines unless otherwise noted.

REPORT OF LABORATORY ANALYSIS

CLIENT: Griffin International
PROJECT NAME: Specialty Paperboard
DATE REPORTED: September 6, 1994
DATE SAMPLED: August 19, 1994

PROJECT CODE: GISP1385
REF. #: 63,383 - 63,392

Enclosed please find the results of the analyses performed for the samples referenced on the attached chain of custody record.

Chain of custody did not indicate sample preservation.

All samples were prepared and analyzed by requirements outlined in the referenced methods and within the specified holding times.

All instrumentation was calibrated with the appropriate frequency and verified by the requirements outlined in the referenced methods.

Blank contamination was not observed at levels affecting the analytical results.

Analytical method precision and accuracy was monitored by laboratory control standards which included matrix spike, duplicate and quality control analyses. These standards were determined to be within established laboratory method acceptance limits.

RE: Site Management Activity Completed, Specialty Paperboard, Brattleboro (site #90-0482)

Dear Mr. Allen:

The Vermont Department of Environmental Conservation, Sites Management Section (SMS) has received and reviewed the October, 1994 Griffin International, Inc. report pertaining to the status of the #6 fuel oil contamination on the Specialty Paperboard property in Brattleboro. Based on the conditions at the site, the SMS has determined that Specialty Paperboard, Inc. has met all of the conditions of the "Draft" Site Management Activity Completed Classification Procedure.

This means that the SMS has determined the following:

- the two #6 fuel oil underground storage tanks at Specialty Paperboard had a release. These tanks were removed on February 1 and 2, 1990.
- investigations into the nature and extent of this release have indicated that the #6 fuel oil is extremely viscous and will not migrate.
- groundwater sampling and analysis of the site indicate that groundwater contaminant concentrations are either non-detectable or below applicable Vermont Groundwater Enforcement Standards.

Based on these findings, the SMS has determined that site management activities have been completed. The completion of these activities does not release Specialty Paperboard, Inc. of any past or future liability which may arise from the petroleum contamination which originated from the leaking underground fuel oil tanks. It does mean that the SMS is not requiring any additional work be performed at this site in response to the 1990 release.

If you have any questions, please feel free to contact Richard Spiese or me at (802) 241-3888.

Sincerely,

Chuck Schwer, Acting-Chief
Sites Management Section
